Multi-Scale Modeling Framework (MMF)

GCM grid column

Multi-Scale Modeling Framework (MMF)

GCM grid column

Periodic lateral
boundary conditions

Multi-Scale Modeling Framework (MMF)

GCM grid column

Periodic lateral
boundary conditions

This idea was proposed and first tested by Wojciech Grabowski.

GCM

NCAR CAM3 Semi-Lagrangian DyCore

T42 (2.8°x2.8°), L30, dt=1800 sec

ALL cloud, PBL, SGS parameterizations are switched off

Super-Parameterization

CSU SAM Cloud Resolving Model (8192 copies)

Anelastic dynamics

Prognostic water/ice static energy, total non-precipitating and total precipitating water

Condensate and hydrometeor partitioning as $f(T)$

Smagorinsky SGS closure

2-D domain (S-N orientation), 32 x 28 grid, dx = 4 km, dt = 20 sec

Radiation transfer for each CRM column (every 900 sec)

Performance

1024 PEs of IBM-SP 'Seaborg' at NERSC

~ 920-fold speedup relative to one processor

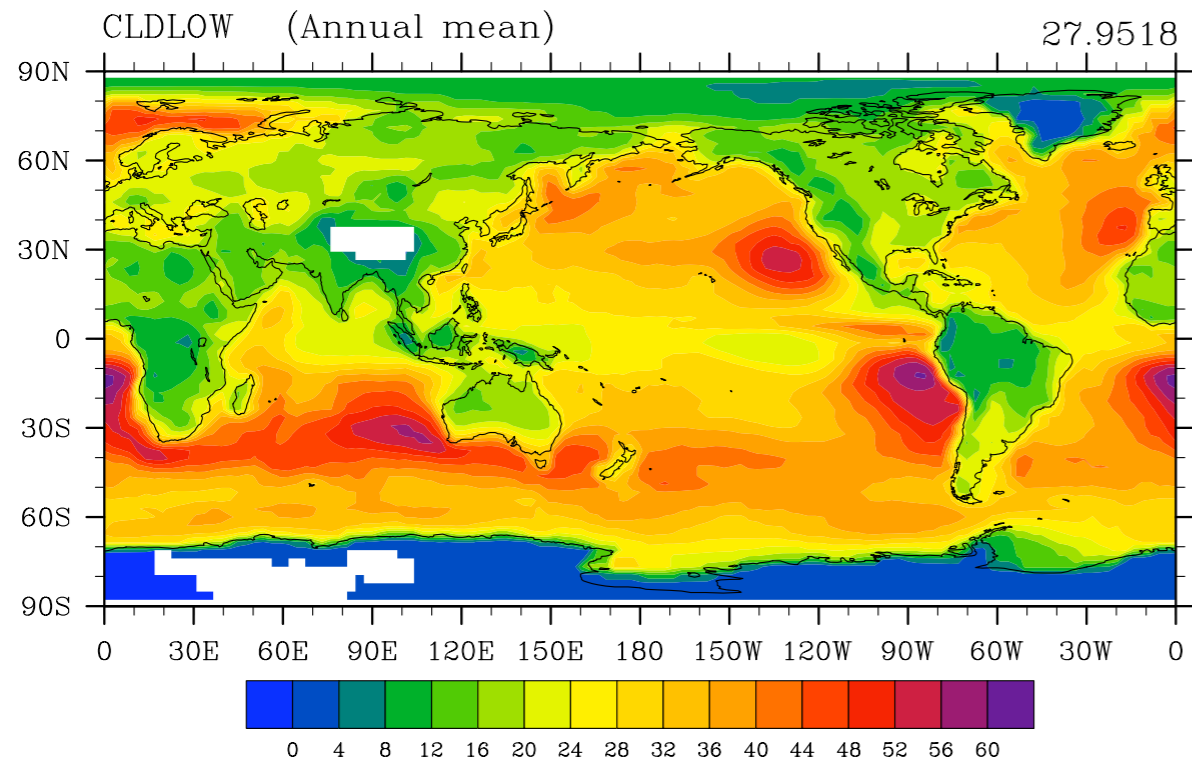

~ 10 simulated months per wall-clock day

AMIP-style experiment

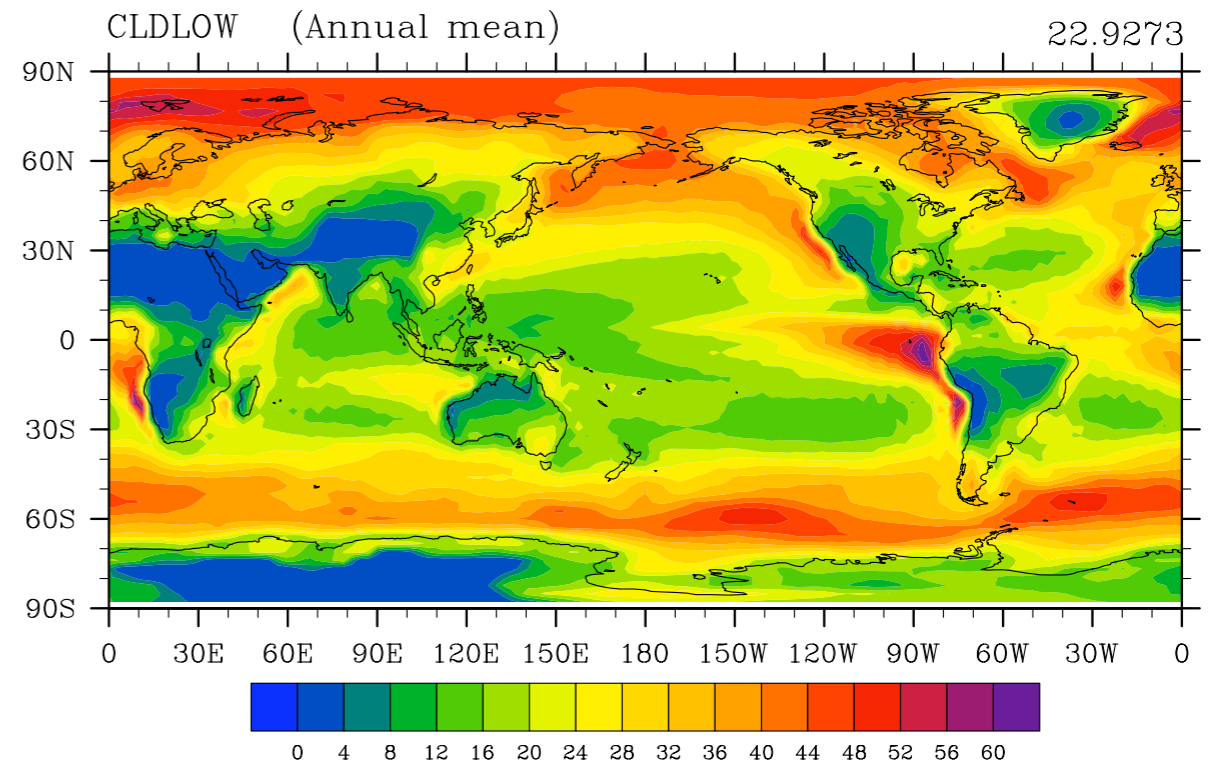

**Prescribed monthly-mean observed SST and ice
September 1985 to August 2001 (16 years)**

CMAP

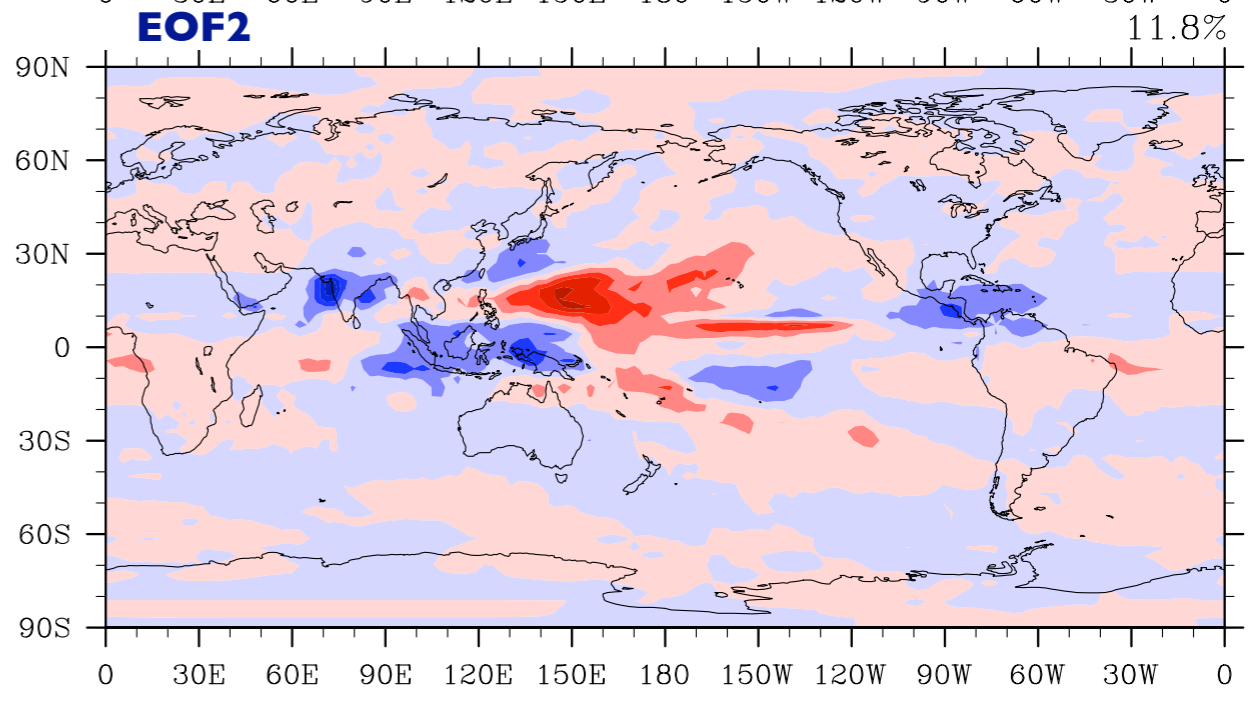

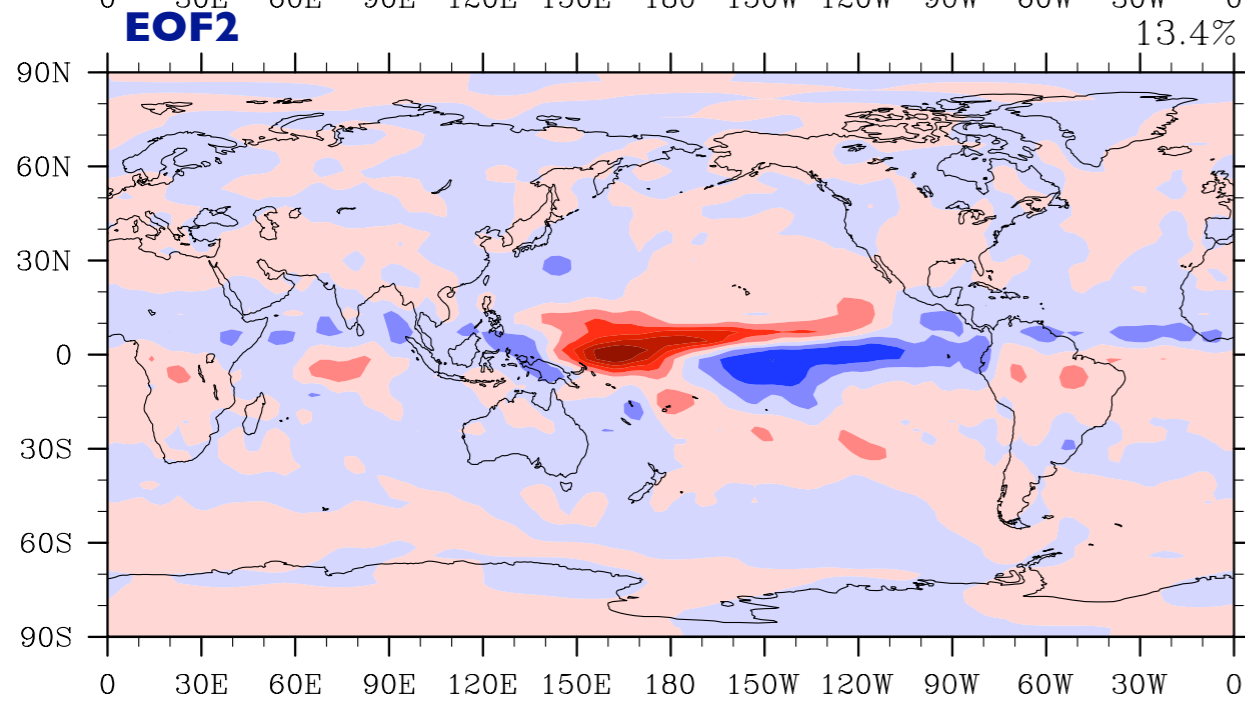

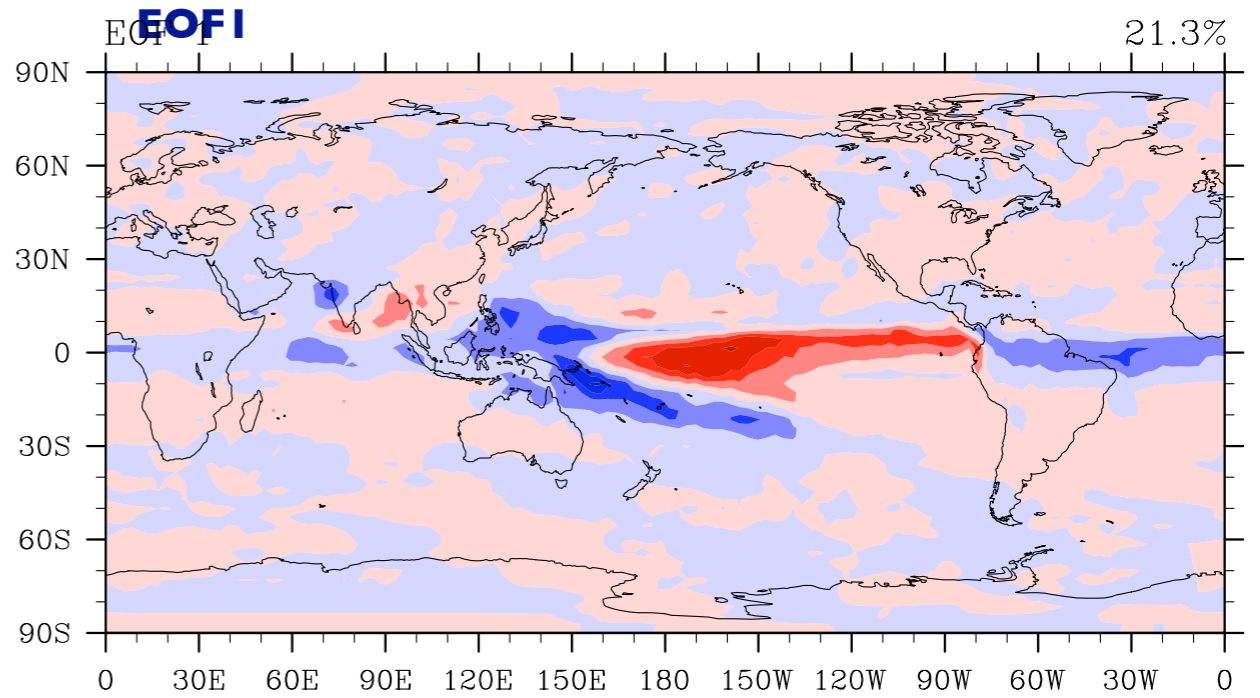

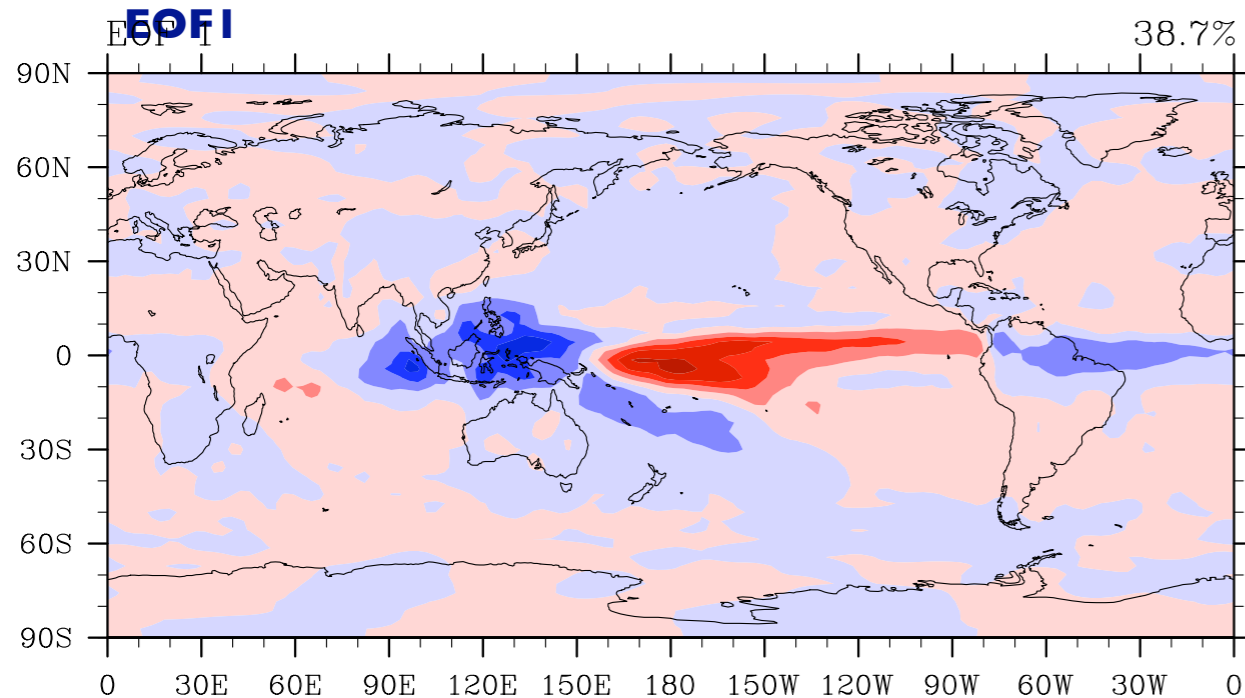

MMF

Subseasonal Variability

Wheeler and Kiladis (1999) procedure was followed:

Daily data

96-day long segments, overlapping by 2 months

Annual, seasonal cycles, and mean removed

Detrended, ends of series tapered to zero

Complex FFT applied in time and space for each lat

Equatorial belt from 15°S to 15°N

Background spectrum is computed by smoothing

Spectrum/background ratio plotted to reveal disturbances

Analysis applied to OLR, Precip, PW, U200, U850, for both observations and model output

Outgoing Longwave Radiation
