

Impact of Snow Cover on Seasonal Prediction

Judah Cohen

Atmospheric & Environmental Research, Inc./
Dept. of Civil & Environmental Engineering, MIT

October 28, 2010

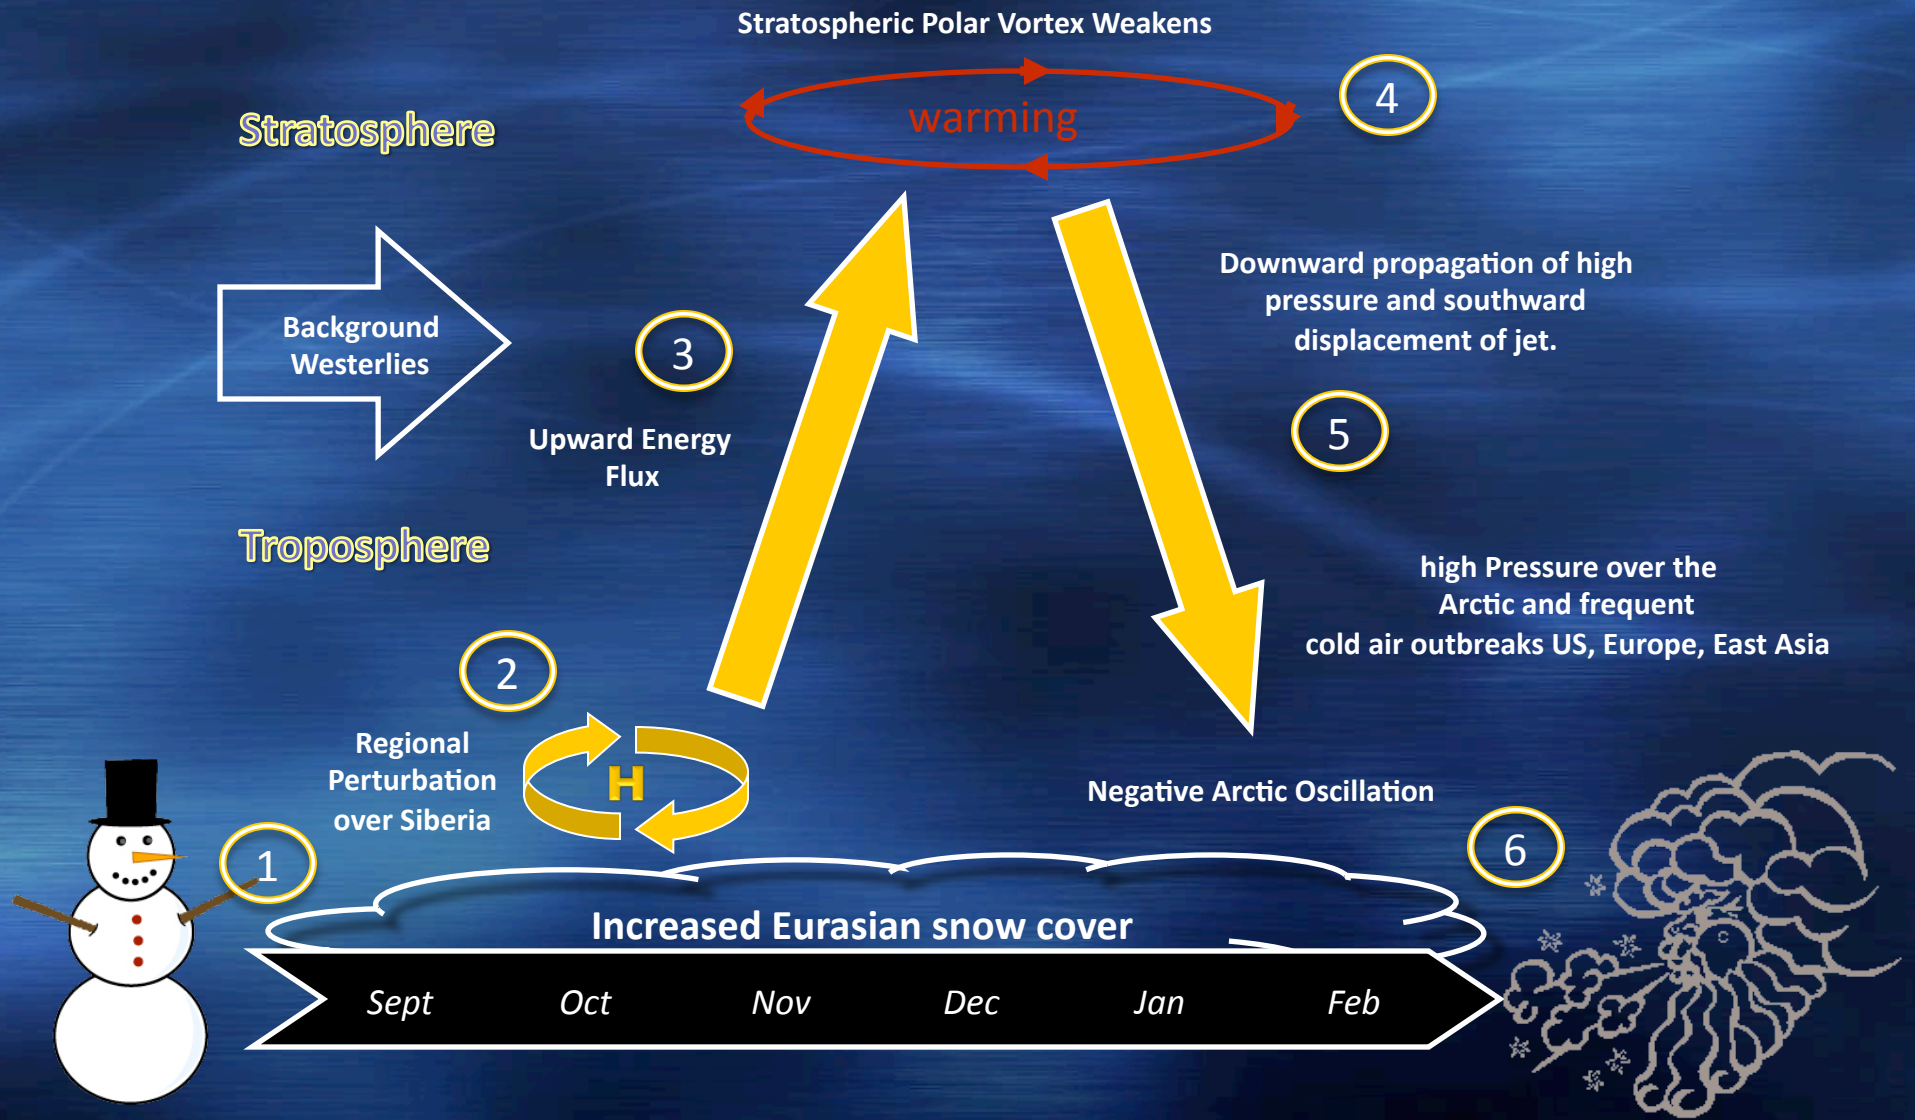

WCRP Workshop on Seasonal to Multi-Decadal Predictability of
Polar Climate

aer

Outline

- Review of dynamical pathway how Eurasian fall snow cover extent leads/forces the leading mode of winter climate variability in the troposphere and the stratosphere (AO/NAM).
- Diagnose the evolution of last winter's extreme AO as a paradigm for how autumn snow influences the hemispheric winter climate.
- Same processes associated with snow variability have also influenced recent decadal trends.
- Present a prediction of the upcoming winter.

Snow Forced Cold Signal (Cohen et al. 2007)

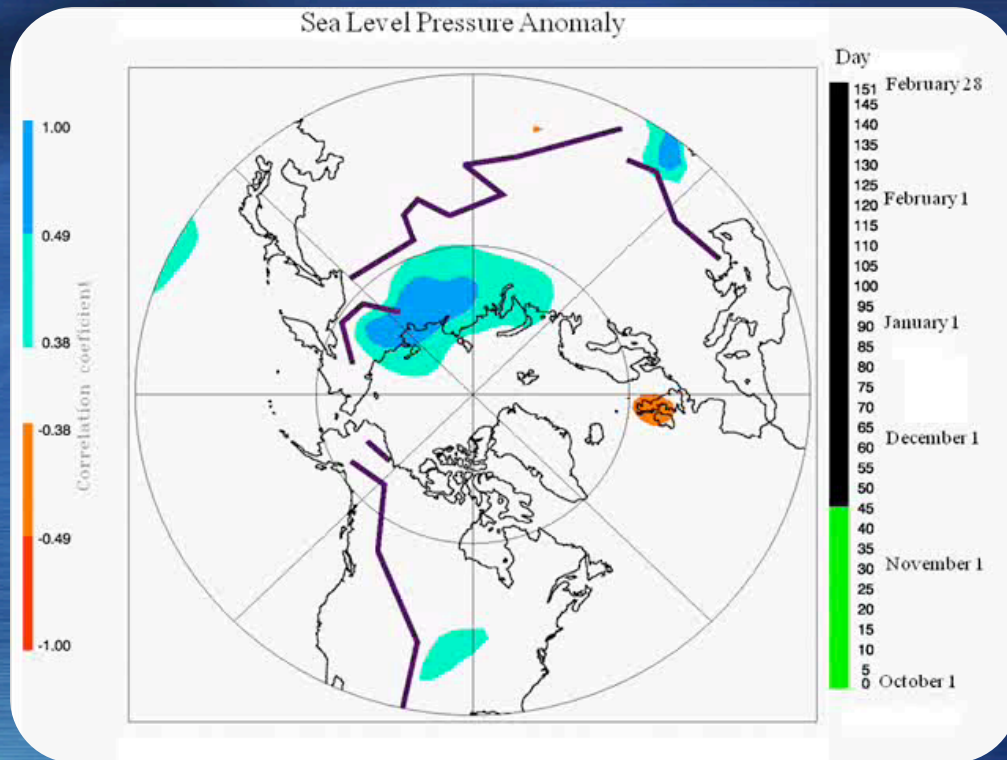

October Snow and Winter AO

- ✓ Statistically significant relationship
- ✓ Very similar decadal trends especially from 1977-1988 and from 1989-present

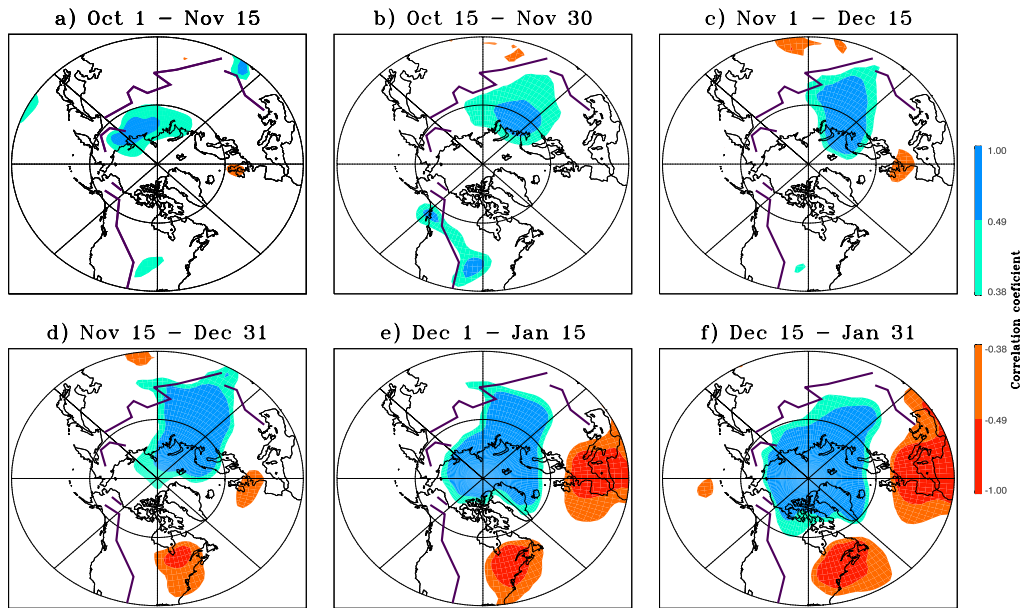

Progression of Siberian High - from Regional to Hemispheric

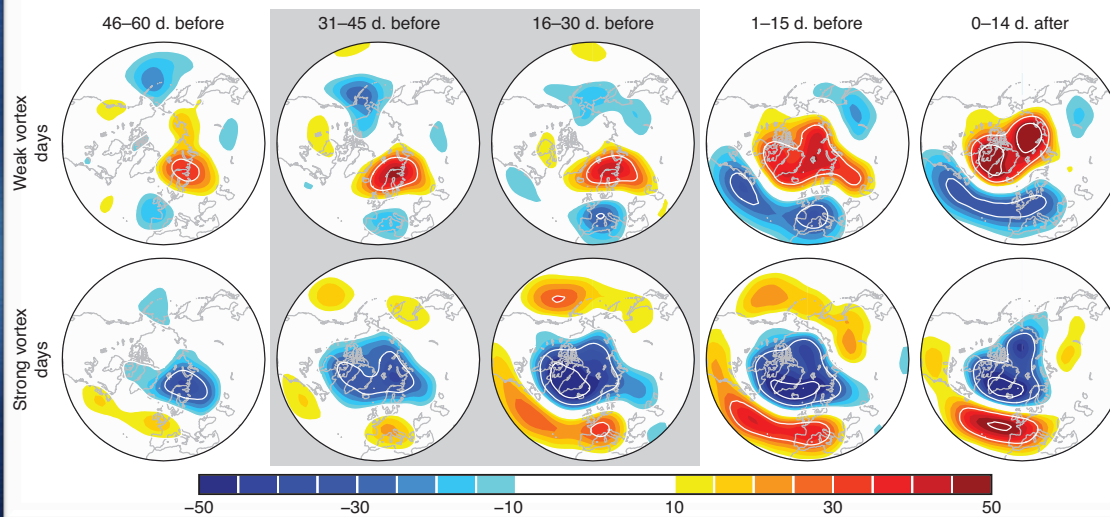

Winter AO events are preceded by same signed regional precursors related to the development of the Siberian High.

Shading represents sea level pressure anomalies averaged for 45 day periods

Tropospheric Precursors

Cohen et al. 2001

Kolstad and Charlton-Perez in press

DJF Arctic Oscillation

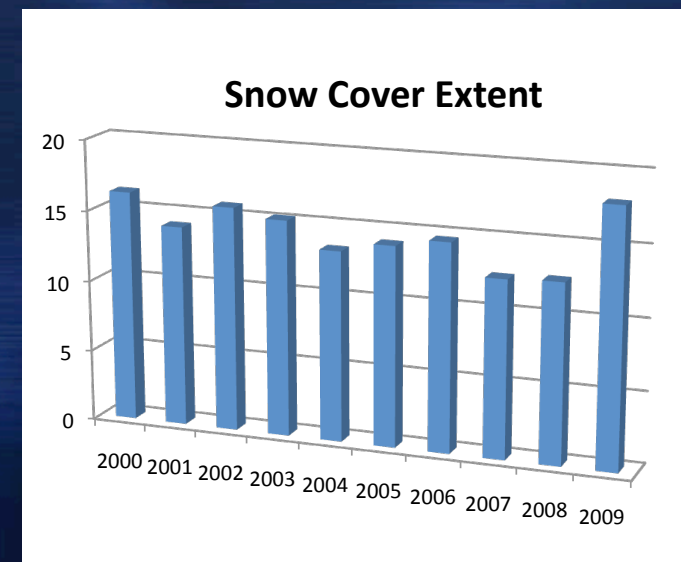

October Siberian Snow Cover

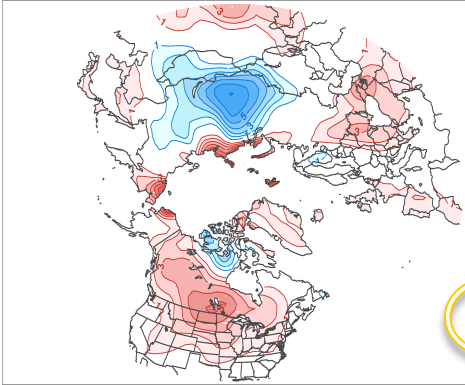

A rapid advance occurred in the last three weeks

Equivalent to the SCE advance across North America from September through January

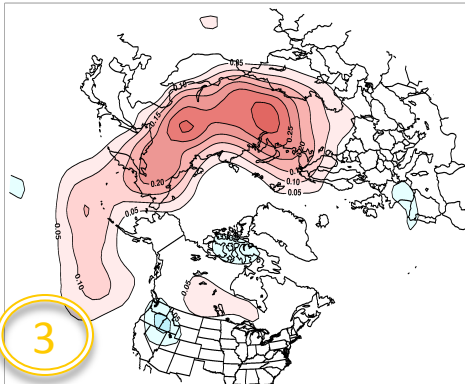

a) Observed Temperature Anomaly: Oct 22 - Nov 14 2009

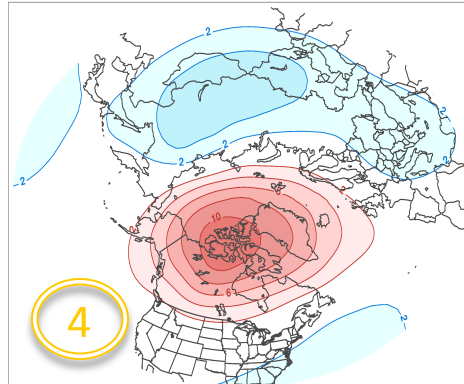

b) Observed Sea Level Pressure Anomaly: Oct 22 - Nov 14 2009

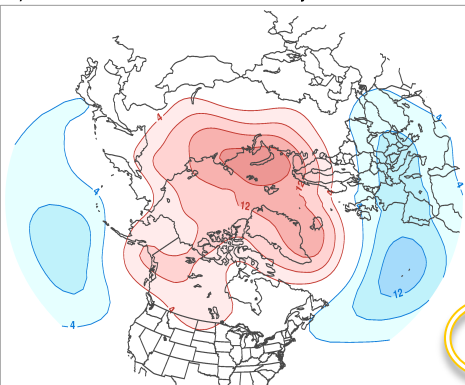

c) Observed 100hPa WAFz Anomaly: Oct 22 - Nov 14 2009

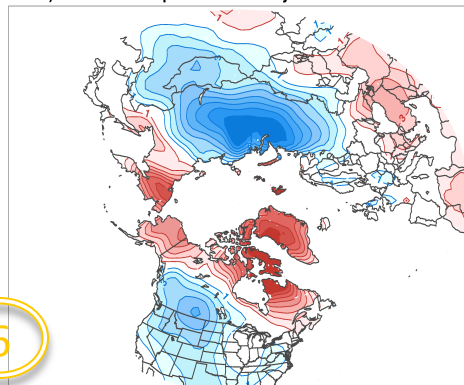

d) Observed 50hPa Temperature Anomaly: Nov 16 - Nov 30 2009

e) Observed Sea Level Pressure Anomaly: Dec 1 - Dec 31 2009

f) Observed Temperature Anomaly: Dec 1 - Dec 31 2009

1

Rapid snow cover advance after October 7.

5

Downward propagation mid Nov-Dec 1 as seen on polar cap plot.

a) Polar Cap GPH Oct-Mar 2009/10

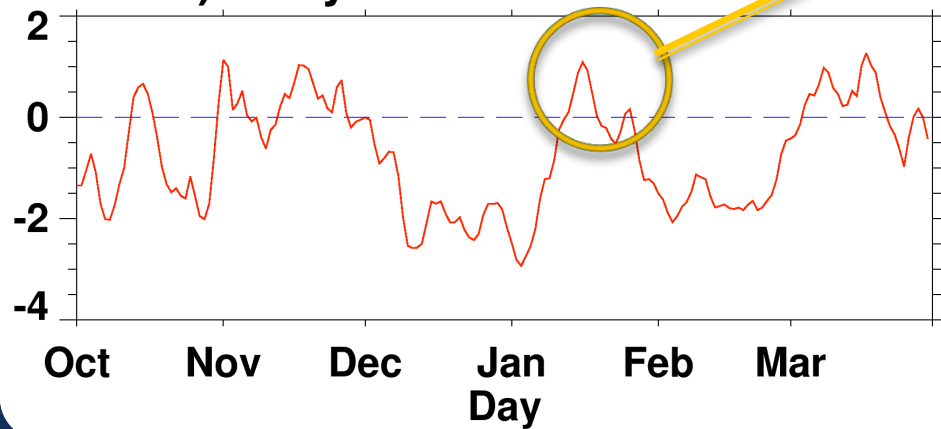

All six steps of snow forced AO are present in succession and with no lag.

a) Polar Cap GPH Oct-Mar 2009/10

The AO event which peaks in mid-December clearly comes to an end by mid-January

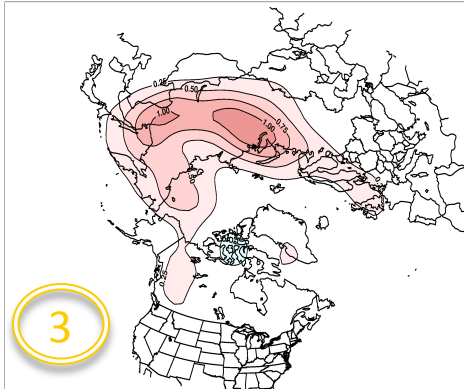

c) Daily AO Oct-Mar 2009/10

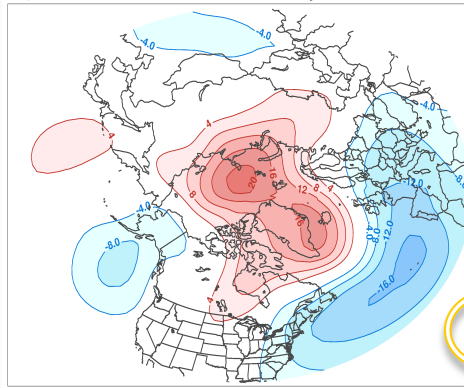

a) Observed Sea Level Pressure Anomaly: Jan 15 - Jan 27 2010

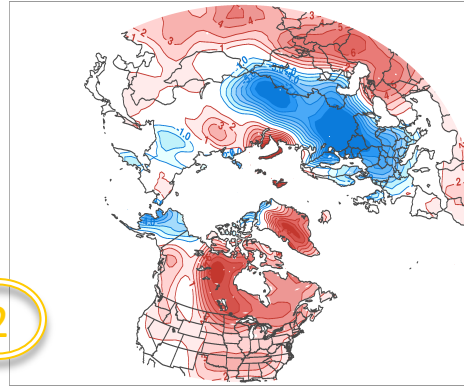

c) Observed 100hPa WAFz Anomaly: Jan 15 - Jan 27 2010

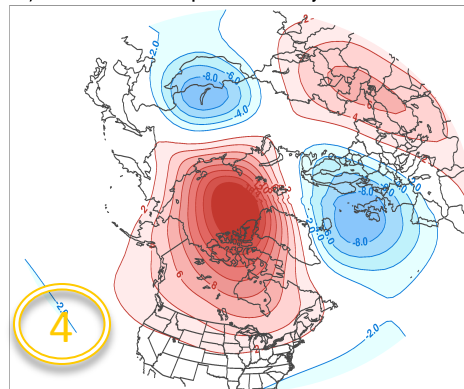

e) Observed Sea Level Pressure Anomaly: Feb 1 - Feb 28 2010

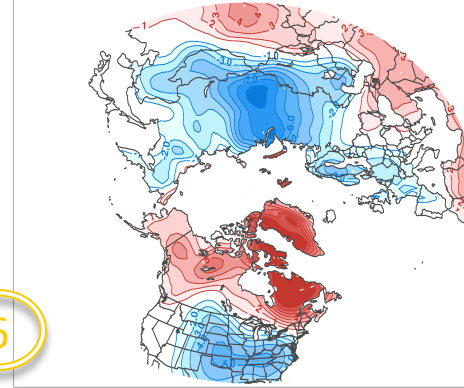

b) Observed Temperature Anomaly: Jan 15 - Jan 27 2010

d) Observed 50hPa Temperature Anomaly: Jan 28 - Feb 7 2010

Observed Temperature Anomaly: Feb 1 - Feb 28 2010

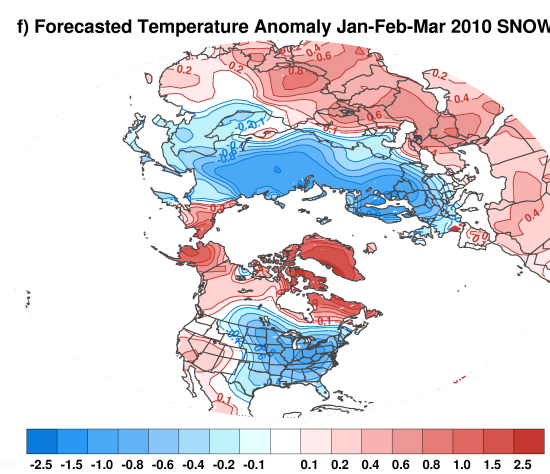

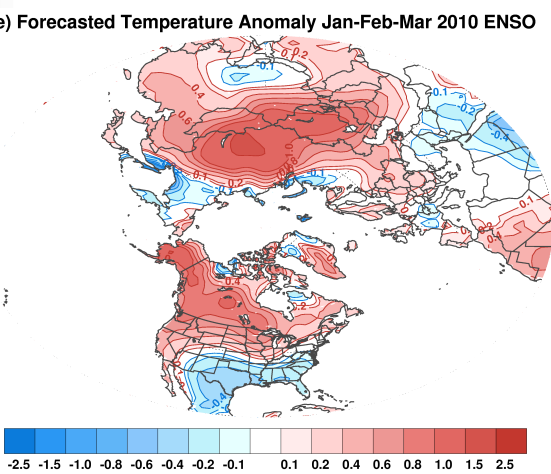

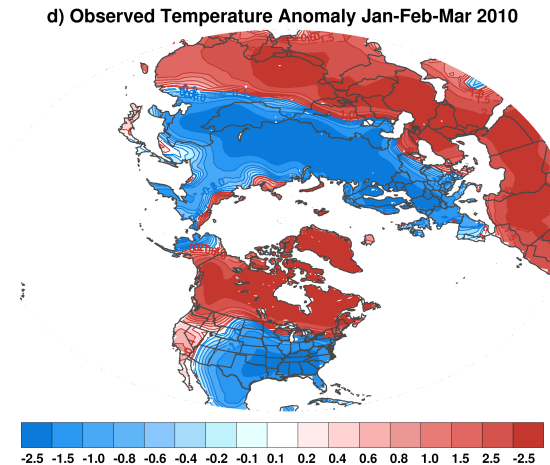

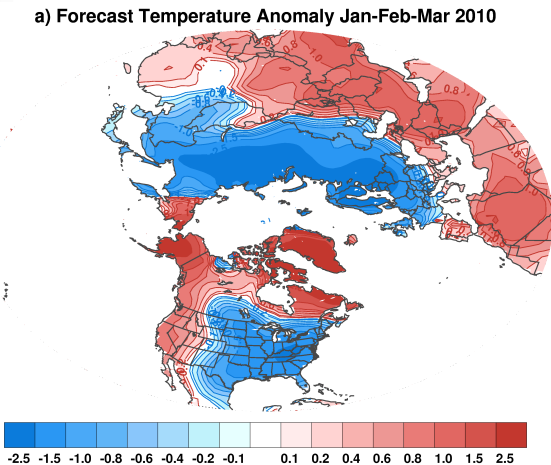

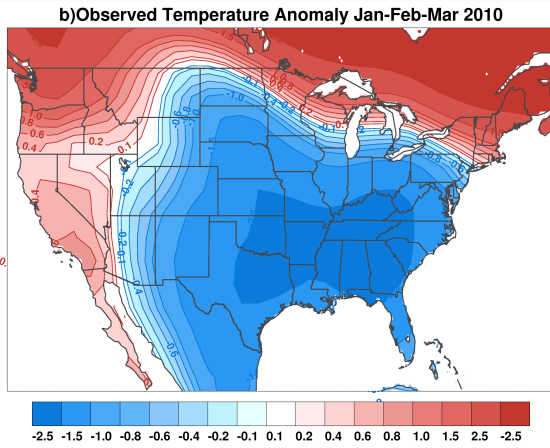

1

Rapid snow cover advance in October and persistently high Eurasian SCE (second greatest winter Eurasian SCE on record).

5

Downward propagation late Jan-Feb 1 as seen on polar cap plot.

All six steps of snow forced AO are present in succession with no lag and is identical of what occurred in the fall.

Forecast posted to the NSF website in real-time:

Based on the skillful http://www.nsf.gov/news/special_reports/model_much_of_the_autumn/winter/forecast.html large-scale predicted temperature

variability is due to

the snow and positive SLP forcing event is not the same as a model result prior to the AO. ENSO only seems to have

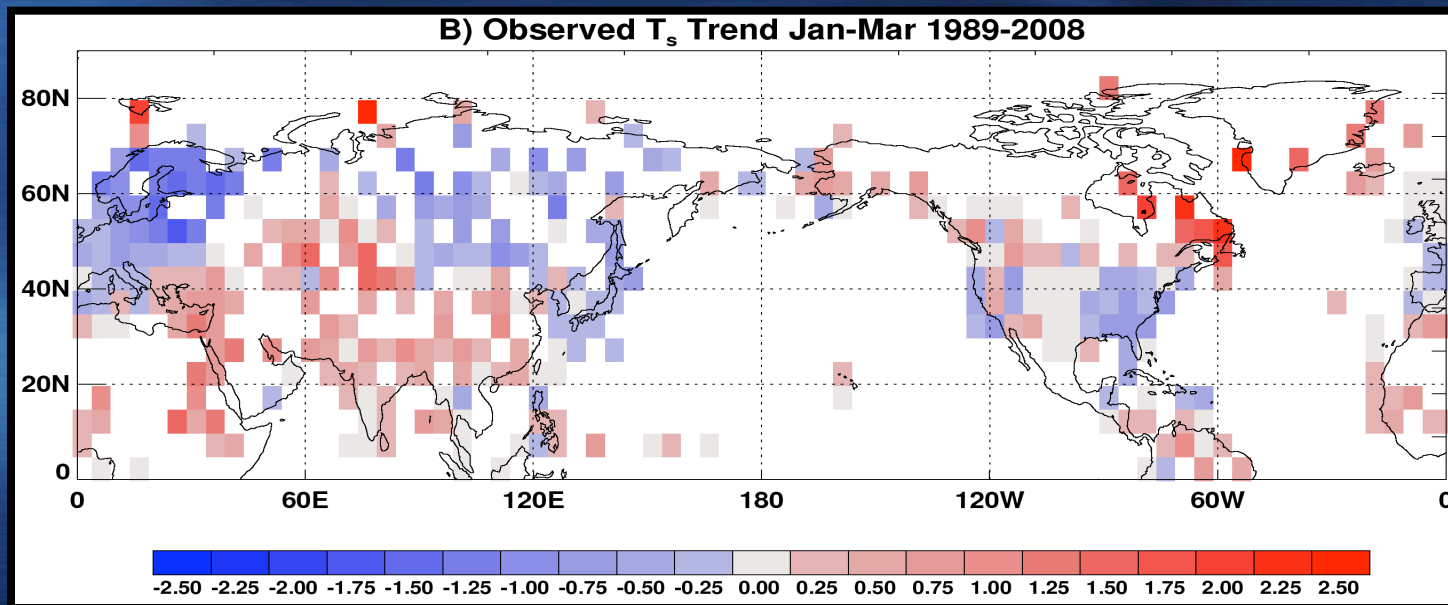

influenced North American temperatures.

Northern Hemisphere Temperature Trends 1969-2008

	OND		JFM		AMJ		JAS	
40 year trend	0.68	0.04	0.70	0.05	0.82	0.03	0.77	0.03
30 year trend	0.60	0.04	0.48	0.05	0.85	0.04	0.80	0.04
20 year trend	0.66	0.06	0.13	0.02	0.73	0.04	0.78	0.04
10 year trend	0.68**	0.09	-0.09	-0.01	0.56*	0.03	0.42	0.02

In the most recent two decades warming has continued in all seasons except for winter (JFM) where the warming trend has broken down or even has reversed.

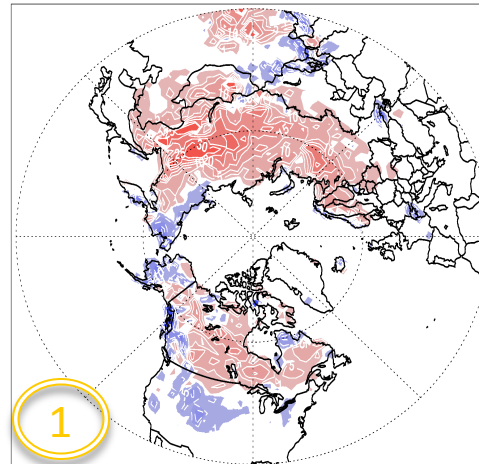

OND and JFM Observed Temperature Trends 1988/89-2008/09

Increased coupling between troposphere and stratosphere in December-January time frame is at least partially responsible for trend reversal between OND and JFM over the past twenty years.

B) Trend of Snow Cover Oct 88-07

D) Trend of 50 hPa Temp Jan 89-08

C) Trend of 100 hPa WAF Dec 88-07

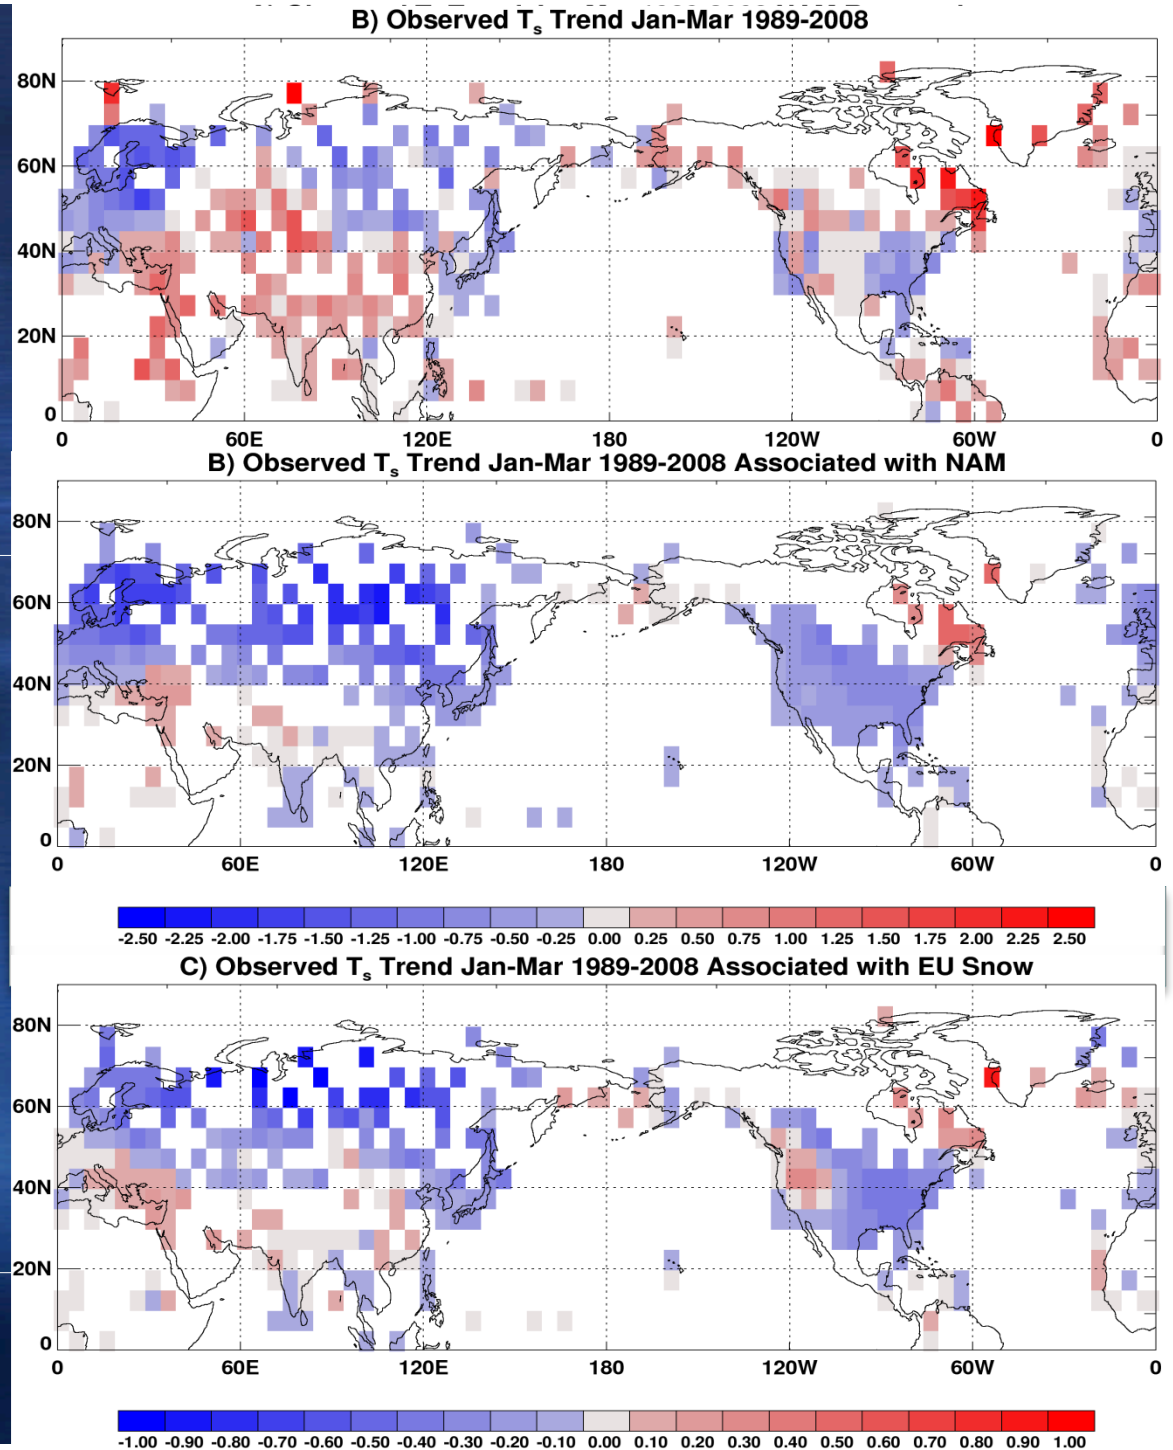

E) Trend of SLP Jan-Mar 89-08

Temperature trend with
AO regressed out

Regression of AO with
surface temperatures

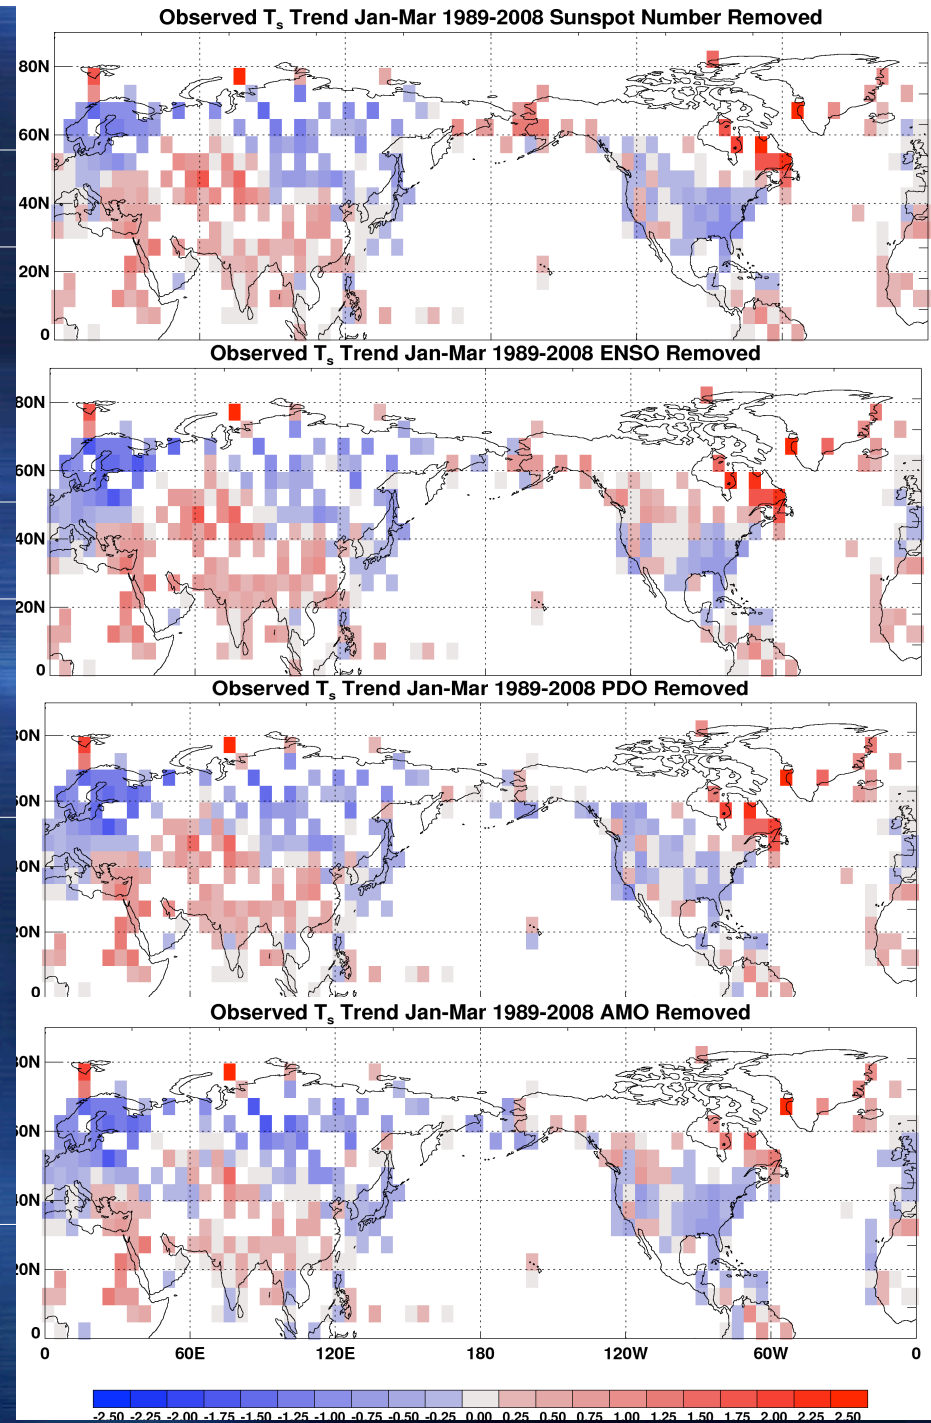

Regression of snow cover
With surface temperatures

Solar variability regressed out

Nino 3.4 regressed out

Temperature trend with
Pacific and Atlantic decadal
indices regressed out

GCMS and snow, Strat/Trop Coupling

Models completely miss link between snow cover variability and vertical EP flux

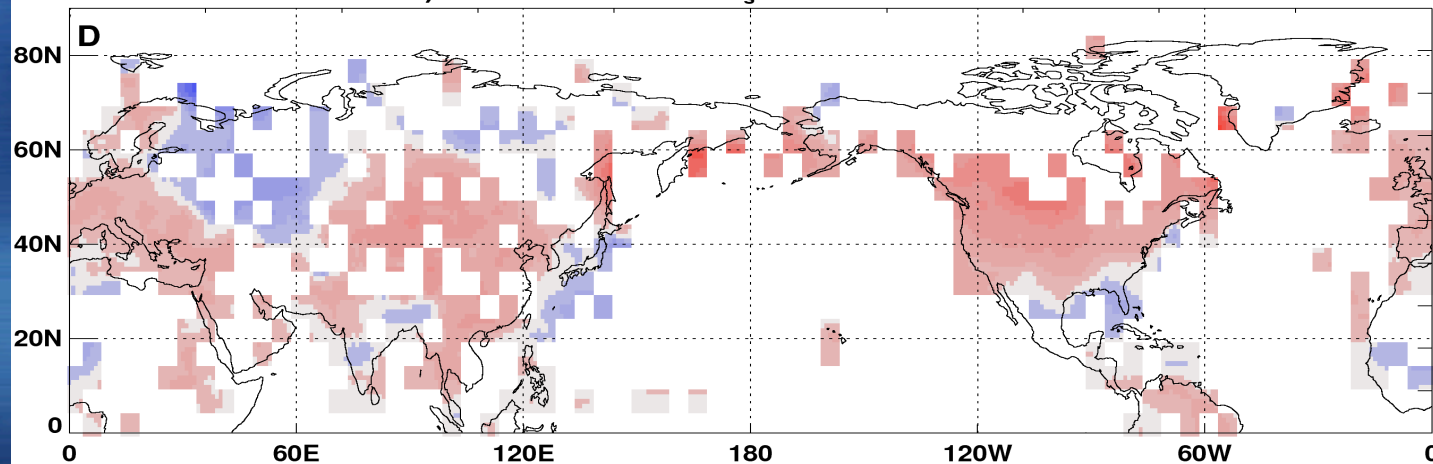

Models also poorly simulate link between leading vertical EP flux and lagging surface response

OND and JFM CMIP3 Simulated Trends

C) CMIP3 Simulated T_s Trend Oct-Dec 1988-2007

D) CMIP3 Simulated T_s Trend JFM 1989-2008

Summary

- It has already been demonstrated that high latitude snow cover and tropospheric precursors are skillful predictors for the high and mid – latitudes of the NH.
- The same dynamical pathway that operates on seasonal timescales can potentially improve our understanding and predictions of decadal variability.
- In my opinion, further improvement in forecast skill would be achieved with further observational and modeling studies. In particular advances can be made in improving model simulations with more effort.
