Tutorial Questions #5 – Solutions
October 15/16

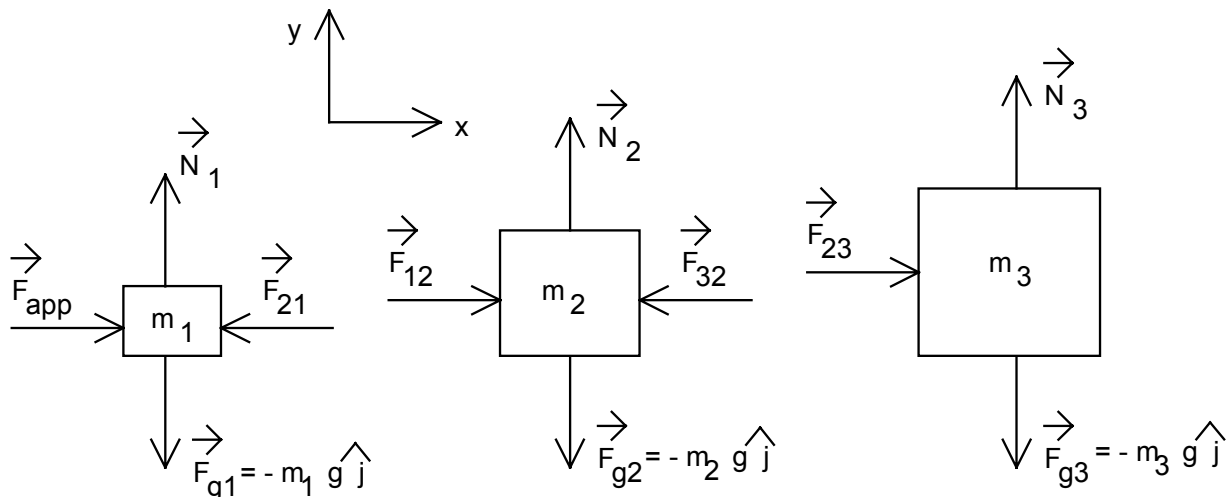

Applying Newton's Laws of Motion

1. Blocks of 1.0, 2.0, and 3.0 kg are lined up from left to right in that order on a table so that each block is touching the next one. A rightward-pointing 12-N force is applied to the leftmost block, as shown below. What is the acceleration of the blocks and what force does the middle block exert on the rightmost one?

Answer:

First draw the free-body diagram for each block. Choose the coordinate system (as shown). Define \vec{F}_{ij} as the force that block i exerts on block j .

Next, apply Newton's Second Law. We only need to consider the horizontal component as there is no motion in the vertical direction. So, applying Newton's Second Law in the x direction gives:

$$\text{block 1: } F_{\text{app}} + F_{21} = m_1 a_1 \quad (1)$$

$$\text{block 2: } F_{12} + F_{32} = m_2 a_2 \quad (2)$$

$$\text{block 3: } F_{23} = m_3 a_3 \quad (3)$$

We appear to have three equations for seven unknowns. However, we can relate some of these unknowns. All three blocks move with the same acceleration, so $a_1 = a_2 = a_3 = a$, which is in the +x direction (positive to the right).

$$\begin{array}{l} \text{Also apply Newton's Third Law:} \\ F_{12} + F_{21} = 0 \\ F_{23} + F_{32} = 0 \end{array} \quad \text{i.e.,} \quad \begin{array}{l} F_{21} = -F_{12} \\ F_{32} = -F_{23} \end{array}$$

So the three equations become:

$$\text{block 1: } F_{\text{app}} - F_{12} = m_1 a \quad (1)$$

$$\text{block 2: } F_{12} - F_{23} = m_2 a \quad (2)$$

$$\text{block 3: } F_{23} = m_3 a \quad (3)$$

and we now only have three unknowns.

We are asked to solve for acceleration a and force F_{23} .

Substitute equation (2) and then equation (3) into equation (1):

$$\begin{aligned} F_{\text{app}} - (m_2 a + F_{23}) &= m_1 a \\ F_{\text{app}} - (m_2 a + m_3 a) &= m_1 a \\ (m_1 a + m_2 a + m_3 a) &= F_{\text{app}} \\ a &= \frac{F_{\text{app}}}{m_1 + m_2 + m_3} = \frac{12\text{N}}{1.0 + 2.0 + 3.0\text{kg}} = 2.0 \text{ m/s}^2 \end{aligned}$$

Then use equation (3) to solve for the force that the middle block (m_2) exerts on the rightmost one (m_3):

$$F_{23} = m_3 a = (3.0\text{kg}) \times (2.0\text{m/s}^2) = 6.0 \text{ N}$$

2. The figure below shows a 0.84-kg ball attached to a vertical post by strings of length 1.2 m and 1.6 m. If the ball is set whirling in a horizontal circle, find
 - (a) the minimum speed necessary for the lower string to be taut, and
 - (b) the tension in each string if the ball's speed is 5.0 m/s.

Answer:

Again, start by defining the coordinate system and drawing the free-body diagram for the ball.. Because this is a case of uniform circular motion, choose an “r-y” coordinate system.

Apply Newton’s Second Law:

$$\vec{F}_{\text{net}} = \vec{F}_g + \vec{T}_l + \vec{T}_u = m\vec{a}$$

Separate this into the r and y components.

y direction:

$$F_{\text{net},y} = F_{g,y} + T_{l,y} + T_{u,y} = ma_y$$

$$F_{\text{net},y} = -mg + T_u \sin \theta = 0$$

$$T_u \sin \theta = mg \quad (1)$$

r direction:

$$F_{\text{net},r} = F_{g,r} + T_{l,r} + T_{u,r} = ma_r$$

$$F_{\text{net},r} = -T_l - T_u \cos \theta = -ma_r$$

$$T_l + T_u \cos \theta = m \frac{v^2}{R} \quad (2)$$

where a_r is the radial (centripetal) acceleration and R is the length of the horizontal string (1.2 m). We can also calculate the angle θ from the lengths of the strings (valid while the strings are taut).

$$\cos \theta = \frac{1.2\text{m}}{1.6\text{m}} \quad \text{so} \quad \theta = 41.4^\circ$$

(a) The lower string will be taut if $T_l \geq 0$. To find the minimum speed that will meet this condition, eliminate T_u from equations (1) and (2).

$$T_l = m \frac{v^2}{R} - T_u \cos \theta = m \frac{v^2}{R} - \left(\frac{mg}{\sin \theta} \right) \cos \theta = m \frac{v^2}{R} - \frac{mg}{\tan \theta}$$

$$m \frac{v^2}{R} - \frac{mg}{\tan \theta} \geq 0$$

$$\frac{v^2}{R} \geq \frac{g}{\tan \theta}$$

We want $T_l \geq 0$, so:

$$v \geq \sqrt{\frac{Rg}{\tan \theta}} = \sqrt{\frac{(1.2\text{m})(9.81\text{m/s}^2)}{\tan 41.4^\circ}}$$

$$v \geq 3.7\text{m/s}$$

(b) Given that $v = 5.0\text{ m/s}$, we can find the two tension forces using the two equations that we have derived.

$$T_u = \frac{mg}{\sin \theta} = \frac{(0.84\text{kg}) \times (9.81\text{m/s}^2)}{\sin 41.4^\circ} = 12\text{ N} \quad (\text{independent of } v, \text{ balances gravity})$$

$$T_l = m \frac{v^2}{R} - \frac{mg}{\tan \theta} = \frac{(0.84\text{kg}) \times (5.0\text{m/s})^2}{1.2\text{m}} - \frac{(0.84\text{kg}) \times (9.81\text{m/s}^2)}{\tan 41.4^\circ} = 8.2\text{ N}$$

3. A block of mass M and height h slides down a slope as shown below. The slope is inclined at angle θ from the horizontal. Connected to the top of the box is an object of mass m . The object is directly above point A on the floor of the box, as shown.

(a) Draw free-body diagrams for mass m and for mass M and identify all forces acting on each at the point when mass m has just been released from the top of the box (i.e., ignore any normal force between the two masses).

(b) If mass m drops from the top of the box, where will it fall relative to A when it reaches the floor, and how long will it take to fall, assuming that the slope is frictionless.

Answer:

(a) Free-body diagrams:

(b) Apply Newton's Second Law to each mass, ignoring friction: $\vec{F}_{\text{net}} = \vec{F}_g + \vec{N} = m\vec{a}$

mass M, x direction: $Mg \sin \theta = Ma_x$
 $a_x = g \sin \theta$

mass M, y direction: $N - Mg \cos \theta = Ma_y = 0$
 $N = Mg \cos \theta$

mass m, x direction: $mg \sin \theta = ma_x$
 $a_x = g \sin \theta$

mass m, y direction: $-Mg \cos \theta = Ma_y = 0$
 $a_y = -g \cos \theta$

Since the acceleration in the x direction is the same for both masses, mass m will fall on point A when it reaches the floor.

To find the time that mass m takes to fall, start with the acceleration in the y direction.

$$a_y = -g \cos \theta$$

$$v_y(t) = v_{oy} + a_y t = v_{oy} - gt \cos \theta$$

$$y(t) = y_o + v_{oy} t + \frac{1}{2} a_y t^2 = y_o + v_{oy} t - \frac{1}{2} gt^2 \cos \theta$$

$$y(t) - y_o = v_{oy} t - \frac{1}{2} gt^2 \cos \theta$$

Thus: $-h = (0)t - \frac{1}{2} gt^2 \cos \theta$

$$t = \sqrt{\frac{2h}{g \cos \theta}}$$
