### Please verify the project information below and make the necessary corrections:

Project title: Modelling of Global Chemistry for Climate

File No: STPGP 235109 - 00

### Co-applicant(s):

J.C. McConnell, Earth and Atmospheric Science, York

N.A. McFarlane, Climate Modelling & Analysis (MSC), Environment Canada

I.A. Folkins, Physics and Atmospheric Science, Dalhousie

J.F. Scinocca, Climate Modelling & Analysis (MSC), Environment Canada

S.M. Polavarapu, Climate & Atmosph. Res. Dir. (MSC), Environment Canada

W.E. Ward, Physics, New Brunswick

P.A. Ariya, Chemistry, McGill

D.V. Michelangeli, Earth and Atmospheric Science, York

J. Li, Climate Modelling & Analysis (MSC), Environment Canada

U. Lohmann, Physics and Atmospheric Science, Dalhousie

J.P.D. Abbatt, Chemistry, Toronto

#### **Supporting Organization(s):**

D.M. Whelpdale, MSC, Environment Canada D.J.W. Kendall, Canadian Space Agency

#### 1. 1. Progress Towards Objectives/Milestones

Using approximately 5 pages, please provide:

- a brief description of the overall objectives of the research project as awarded;
- a description of the progress made towards these objectives during the period covered by this report; and
- a description and justification for any deviations from the original objectives and a discussion of the path forward.

The broad objectives of the GCC project are the development and use of a capability for modelling the global chemical climate of the atmosphere, both for climate change studies and for the integration of models and measurements. The achievement of our objectives is discussed for each of these aspects in turn. With the exceptions noted below, all tasks are proceeding on schedule.

## Climate model development and validation.

RA D. Plummer has coordinated the development of the tropospheric chemistry module in CMAM, including improved sources and sinks (Task I). More recently he has been investigating the use of a hybrid coordinate for the advection of chemical species. Basic research has been conducted on aerosol properties and formation processes by the Abbatt and Lohmann groups (Task II), and on organic and sulfate oxidation processes by the Ariya group (Tasks I, II). Basic research on dynamics and transport has been conducted by the Shepherd group (Task III). Implementation of the correlated-k radiation scheme in CMAM (Task IV) by Li and RA V.I. Fomichev has been delayed because of problems CCCma had with the scheme, but is proceeding; other aspects of Task IV have progressed in the meantime. Comparison of CMAM fields with a variety of in-situ and space-based measurements have been carried out by the Folkins, McConnell, Shepherd, and Ward groups (Task VI). We continued our participation in the SPARC GRIPS middle atmosphere GCM intercomparison activity, sending a delegation to the annual GRIPS workshops in Tskuba, Japan (2002), Washington D.C. (2003) and Bologna, Italy (2004).

# Climate model applications.

Scinocca, RA C. McLandress, and post-doc L. Campbell, have investigated the driving of the QBO by parameterized gravity waves in the tropics (Task XII). The sensitivity of the resolved tropical waves to the parameterization of convection has been assessed (Task XIII) within the context of a SPARC GRIPS subproject, leading to an international collaborative paper submitted to J. Atmos. Sci. We participated (by invitation) in the inaugural SPARC/SCOSTEP workshop on temperature trends in the upper atmosphere (Kuhlungsborn, 2002). Resulting from this workshop, RA V.I. Fomichev was part of an international collaborative paper submitted to Rev. Geophys. that documented the temperature trends in the upper atmosphere and provided supporting model simulations including the results of CMAM. We were also asked to participate in an intercomparison of five fully interactive chemistry-climate models for the 2002 WMO/UNEP Ozone Assessment (falling within Task VII, although not specifically anticipated). (These Assessments, now conducted every four years, form the scientific basis for the Montréal Protocol and its amendments.) The latest generation of models - one from the UK, one from Japan, two from Germany, and CMAM - was used to provide the current best estimate of future ozone changes, focusing on the coupling between the ozone layer and climate change. This was a significant effort in terms of both human and computational resources (mainly by RA S.R. Beagley and Shepherd, though many others also contributed), but we felt it was important for Canada to contribute to this activity. The results are described in Austin et al. (2003), and had a major impact on the conclusions of the 2002 Assessment. Taken together, the new simulations predict that there will not be a severe Arctic ozone hole (resulting from climate change) rivalling that of the Antarctic in the coming decades; this is in contrast to simpler calculations considered in the 1998 Assessment. This underscores the importance of participating in international assessments, because the collective result was much stronger than an individual model result could ever be. We will publish more detailed analyses of our own simulations in due course.

# Data assimilation development and validation

(Task V). After coupling CMAM to MSC's 3D variational (3DVAR) data assimilation scheme (referred to as CMAM-DA), statistics had to be defined that were appropriate for the model, and the 3DVAR scheme had to be adapted for a generalized vertical coordinate. Although originally an analysis of the early UARS period was planned, the lack of appropriate data precluded this. Instead, it was decided to analyse a more recent period, which would also have the added benefit of making the CMAM-DA product useful for current activities. It was specifically decided to produce analyses for January-March and August-October of 2002, in order to support the Canadian high Arctic (winterspring) and MANTRA (late summer) measurement campaigns — as well as to assimilate the unprecedented Antarctic ozone hole of 2002. In early 2003 the CMAM-DA system was adapted to use the latest version of the CMAM with T47L65 resolution and interactive, heterogeneous chemistry. This updated system has been validated for one month (January 2002) and compared against the UKMO analysis. The results of this work have been submitted for publication. Polavarapu was invited to attend and speak at the SPARC data assimilation workshop held in Florence, Italy in early June 2003. As with all aspects of the project, the recent change of supercomputers at MSC Dorval has slowed development of the CMAM-DA model. The latest version of CMAM has now been modified to include the digital filter and will soon be run long-term as the basis of the CMAM-DA project.

The CSA has recently established a *Facility for Data Assimilation and Modelling* built around the CMAM, known as the *CMAM-FDAM*. The CMAM-FDAM will ensure that the capability developed by the GCC project will continue to be available for the benefit of the CSA Atmospheric Environment community. Initial funding has been provided for 3 years, which will support a core group of Research Associates. (Matching funding is currently provided through the GCC project.) A Steering Committee composed of MSC and university members will oversee the activity. We will have a initial event later this year, likely a workshop which could be part of the next CSA Atmospheric Environment workshop.

## *Interpretation and analysis of measurements* (Task X).

RA C. McLandress has used CMAM data to construct synthetic measurements of stratospheric winds and ozone fluxes, in order to assess the measurement requirements (especially accuracy) needed to achieve the science goals of the Canadian SWIFT instrument. These calculations have formed the basis of the SWIFT "Mission Requirements Document" put together by the European Space Agency, which is managing the mission. RA K. Semeniuk has continued the work on developing a trajectory model to facilitate comparison between CMAM fields and retrievals from the Canadian OSIRIS, ACE and MAESTRO instruments. We have recently provided a comparison data set for ACE analyses, and are participating in the ACE validation effort. In related work, RA D. Sankey has assessed the validity of using chemical correlations to infer missing species. On the basis of this work, it can be argued that the limited latitudinal and temporal sampling from occultation instruments is mitigated, for long-lived species, by high-resolution vertical sampling. At the University of Toronto there is increasingly close collaboration between the CMAM activities and those of several Canadian measurement programs overseen by Prof. Kim Strong. In particular RAs C.

McLandress and D. Sankey have provided CMAM chemical data that is being used for comparison with ground-based measurements made in the Canadian high Arctic (Eureka, Resolute Bay) and at the Toronto Atmospheric Observatory, and also measurements obtained from the MANTRA balloon campaign at Vanscoy, Saskatchewan. Such collaborations help to validate or identify deficiencies in CMAM, while at the same time aiding the scientific interpretation and understanding of variability of the measurement studies. In the future, chemical analyses from CMAM-DA (which, unlike the case with the free-running CMAM, can be associated with the particular day of a given measurement) will be used, which will provide even more useful comparisons as well as possible a priori profiles for retrievals.

The technology transfer of the stratospheric chemistry module of CMAM to MSC (Task XIV), which is the responsibility of Scinocca and RA S.R. Beagley, is essentially complete — the code is now being run and further optimized within the CCCma environment. CCCma is now in a position to perform its own climate simulations addressing the interaction between ozone depletion and climate change. Later in the project, the tropospheric chemistry module being developed by GCC will also be transferred to MSC, and will be designed to extend its existing sulphate chemistry in a natural fashion. When coupled with other modules (land-surface, biogenic emission/uptake, ocean), CCCma will have the capability of simulating chemical climate in a fully interactive fashion, thereby helping it to stay at the leading edge of the IPCC assessment activity.

The development of a stratospheric data assimilation capability based on CMAM is now essentially complete, and CMAM will soon be running in a continuous data assimilation cycle using current data. This development has led to some spin-off benefits for the operational NWP assimilation activities at MSC. Because CMAM is being run with stratospheric chemistry, the stratospheric analyses will include chemical as well as dynamical fields. (Unlike with dynamical fields, it is not necessary to assimilate chemical fields in order to produce a useful chemical analysis; this fact underlies the use of Chemical Transport Models.) As a first application, it is anticipated that MSC may soon be able to use the CMAM ozone analyses. CMAM chemical analyses should also be useful for direct comparison with current Canadian stratospheric chemistry measurement programs such as MANTRA (balloon), OSIRIS, ACE and MAESTRO (satellite), and Eureka (ground-based). The CMAM middle atmosphere data assimilation capability (both dynamical and chemical) will be a unique tool within the international context, which will enable CSA to assess proposed new measurement strategies in a sophisticated fashion.

The highly collaborative nature of our project is reflected in various ways: in our active Scientific Steering Committee (which has met in person to coordinate the research for at least one full day ten times since 1 April 2001, with the next meeting scheduled for late July 2004); in the CMAM data assimilation subgroup (see further discussion in item 8); and in the many research collaborations between different members of the project.

As well as the paper and conference presentations in the table below, we have held our annual workshop in December of 2001, 2002 and 2003. Each year the workshop lasts for

2 days, and incorporates talks from the majority of the students, postdocs and research associates involved in the project. 3 internationally renowned speakers are invited from outside Canada to give talks, leading to an increased awareness of the project beyond the Canadian borders, as well as providing insight into topics with which we may not altogether be familiar.

During the past twelve months we have also sponsored two one-week summer schools. The first, held in Montréal during August 2003, was on the topic of Global Chemistry and Climate of the Troposphere and Lower Stratosphere. The lecturers were Jon Abbatt, Parisa Ariya, Ian Folkins, Glen Lesins, Ulrike Lohmann, Norm McFarlane, Diane Michelangeli, David Plummer, John Scinocca, Ted Shepherd, and Knut von Salzen. There were 50 attendees, the majority of which were from Canada, but there were several international applicants from both the USA and Eurpoe.

More recently we held a one-week summer school in Banff on Comparison of Models and Measurements during May 2004. The program was designed to bring together the modelling and measurement communities. For example, data assimilation and retrieval theory have a great deal in common but this is not always clear because of "language" differences. The lecturers were Jack McConnell, Ted Shepherd, Ian McDade, Dylan Jones, William Ward, Saroja Polavarapu, Michelle Santee, Tom McElroy, Charles McLandress, Stella Melo, and Richard Menard. There were 35 other participants. It was a tremendously successful event and we are considering the possibility of making it an annual event, with changing foci, perhaps within the auspices of the CMAM-FDAM.

The existence of the GCC network has permitted the use of CMAM to support other CFCAS-funded activities. Prof. K. Strong's project on Arctic measurements of stratospheric change (GR-029) involves comparison with CMAM chemical data: RA K. Semeniuk is now the designated GCC contact. Prof. G.G. Shepherd's project on analysis of long-term WINDII measurements in the mesopause region (GR-339) likewise involves comparison with CMAM climate simulations; RA C. McLandress is the primary GCC contact. Both activities will be represented in our GCC annual workshops.

Finally, it was noted at the MSC/CFCAS Climate Research Workshop in Ottawa on 5 March 2002 that Canadian scientists no longer played such prominent roles at the international level (e.g. WCRP, IPCC) as they had in the past. Certainly in the case of GCC, CFCAS is helping to rectify that situation. GCC actively promotes and facilitates the participation of its members in relevant international activities; many instances of this have been noted in this report.

We recently archived a special 20-year CMAM data set with high temporal resolution data at selected locations, output from the latest version of the model. (For chemistry: Toronto, Vanscoy, Eureka, Resolute Bay, OHP (France), Jungfraujoch, Kiruna, Lauder, and a Southern Hemisphere conjugate of Eureka. For dynamics: London (Ontario), Saskatoon, Platteville, Wakkanai, Yamagawa, Tromso, Hawaii and Christmas Island.) The data set is being used by Kim Strong's and Alan Manson's research groups, to compare with their measurements. Preliminary investigation has shown that these new data agree

much better with the results from MANTRA than those of the previous version of the model

#### 1. Research Team

Please provide an overview of the participation in, and scientific contributions to, the project of each member of the research team (principal investigator, co-investigators, senior research associates, company and government scientists, collaborators and students etc.).

- T.G. Shepherd, Principal Investigator, Toronto: Tasks III, V, VII
- J.C. McConnell, Co-investigator, York: Tasks I, VI, VII
- N.A. McFarlane, Co-investigator, Environment Canada: Tasks IV, VII
- I.A. Folkins, Co-investigator, Dalhousie: Task VI
- J.F. Scinocca, Co-investigator, Environment Canada: Tasks III, XIII, XIV
- S.M. Polavarapu, Co-investigator, Environment Canada: Tasks V, XI
- W.E. Ward, Co-investigator, New Brunswick: Tasks VI, X
- P.A. Ariya, Co-investigator, McGill: Tasks I, II
- D.V. Michelangeli, Co-investigator, York: Tasks I, II, IX
- J. Li, Co-investigator, Environment Canada: Task IV
- U. Lohmann, Co-investigator, Dalhousie: Task IX
- J.P.D. Abbatt, Co-investigator, Toronto: Task II
- R. Ménard, Collaborator, Environment Canada: Tasks V, XI
- Y. Rochon, Collaborator, Environment Canada: Tasks V, XI
- J. Anstey, Ph.D. student, Toronto: Task VII
- S.R. Beagley, Research Associate, York: Tasks VII, XIV
- F. Bender, undergrad summer student, Toronto: Task X
- C. Braban, Ph.D. student, Toronto: Task II
- C. Braun, Research Assistant, Dalhousie: Task VI
- L. Campbell, Post-doctoral fellow, Toronto: Task XII; now Assistant Professor at Carleton
- B. Carlin, Ph.D. student, Dalhousie: Task II
- D. Chartrand, Research Associate, York: Tasks IX, X; now with Jacques Whitford Environmental Consultants
- S. Codoban, Ph.D. student, Toronto: Task III
- J. de Grandpré, Research Assistant, McGill: Tasks III, XIII
- G. Folberth, Post-doctoral fellow, Victoria: Task I
- V.I. Fomichev, Research Associate, York: Tasks IV, VIII, X
- M. Fruman, Ph.D. student, Toronto: Task III
- C. Fu, Ph.D. student, York: Task VI
- R. Hallman, undergrad summer student, Toronto: Task VI
- A. Jonsson, Ph.D. student, Stockholm (long-term visitor at York): Task VI

- J.N. Koshyk, Research Associate, Toronto: Tasks V, VI; now with TD Bank
- E. Leon, Research Assistant, Toronto: Task VI
- J. Liang, undergrad summer student, Toronto: Task V; now a grad student at York
- J.V. Lukovich, Ph.D. student, Toronto: Task III; now an RA at Manitoba
- D. Matthews, M.Sc. student, McGill: Task II
- C. McLandress, Research Associate, Toronto: Tasks X, XII
- L. Neef, M.Sc. and Ph.D. student, Toronto: Task V
- D. Pendlebury, Ph.D. student, Toronto: Task III; now Project Scientist with the SPARC International Project Office, Toronto
- D. Plummer, Research Associate, York: Task I; now Research Scientist with Environment Canada
- M. Pritchard, undergrad summer student, Toronto: Task VI; now a grad student at Alberta
- G. Probst, M.Sc. student, McGill: Task I
- C. Reader, Research Associate, Victoria: Task II
- S. Ren, Research Associate, Toronto: Task V
- M. Reszka, Post-doctoral fellow, Toronto: Task V
- B. Revenaz, M.Sc. student, McGill: Task I; now with an environmental consulting company in the US
- J. Russell, Post-doctoral fellow, UNB: Task VI
- A. Ryzhkov, Post-doctoral fellow, McGill: Task I
- D. Sankey, Research Associate, Toronto: Tasks III, V, X, XI
- K. Semeniuk, Research Associate, York: Task IX, X
- T. Shaw, undergrad summer student and then grad student, Toronto: Task XIII
- A. Tang, Ph.D. student, York: Task X
- J. Taylor, undergrad summer student, UNB: Task X; now a grad student at Toronto
- Y. Tomikawa, Post-doctoral fellow, Toronto: Task VI
- D. Vyushin, Research Assistant, Toronto: Task III; now a grad student at Toronto
- X. Wang, Post-doctoral fellow, York: Task IX
- Y. Yang, Research Associate, Toronto: Task V
- X. Zhang, M.Sc. student, York: Task VI; now an RA at York

## 3. Training

Please provide the number of each type of trainee involved in the strategic project to date and the percentage (%) of time each type of trainee spent on this project.

	Number	% TIME SPENT ON PROJECT
Undergraduate Students	6	100 (SUMMER ONLY)
Master's Students	5	35
DOCTORAL STUDENTS	11	80
Postdoctoral Fellows	7	90
RESEARCH ASSOCIATES	11	100
Technicians		
OTHER (RESEARCH ASSISTANTS)	4	100
TOTAL	44	

# 4. Dissemination of Research Results and Knowledge or Technology Transfer

Please list all publications (specify if submitted, accepted or published), conference presentations, workshops, patents (applied for and granted), and licenses to date arising from the research project supported by the grant.

# Publications, Conference Presentations, etc. None to date -or-

## **Prospects for the Transfer of the Results to the User Sector**

Describe how the results achieved to date are being transferred to the user sector and the prospects for their commercial/industrial exploitation or their use by other sectors (e.g., revising or formulating policy or regulations).

As mentioned above, the technology transfer of the stratospheric chemistry module of CMAM to MSC is essentially complete, and the code is now being run and further optimized within the CCCma environment. CCCma is now in a position to perform its own climate simulations addressing the interaction between ozone depletion and climate change. Later in the project, the tropospheric chemistry module curently being developed by GCC will also be transferred to MSC, and will be designed to extend its existing sulfate chemistry in a natural fashion.

## 5. Problems Encountered

Identify the main problems encountered during this instalment of the grant from the list below (select all that apply):

(select all that apply):
Technical or scientific problems Problems with direction of research or findings Equipment and facilities Staffing issues (including students) Funding problems Partner(s) abandoned project Other (specify):
-or-
☐No problems occurred during this instalment of the grant.
Briefly describe the main problems identified above and the steps taken to resolve each one:

The main problem encountered during this phase of the grant has been the several transitions to new supercomputers at MSC, each of which has caused significant delays in turnaround. This has slowed progress in both climate model applications and data assimilation. However, both the global climate model and the CMAM-DA version of the model are now working well on the new supercomputers.

#### Collaboration with Partners

6.

ho initiated this strategic project? the university researcher; the industry partner (if applicable); the government partner (if applicable); and/or other (specify):
what way were the partners directly involved in the project (select any that apply)?  Partners were not involved in the project apart from their financial and/or in-kind contribution.  Partners were available for consultation.  Partners provided facilities.  Partners participated in the training.  Partners discussed the project regularly with the university team. (List the number of meetings during the period covered by this report.)  Partners were involved in the research.

Describe their involvement and comment on the collaboration:

Our non-academic partners are the Meteorological Service of Canada (MSC) and the Canadian Space Agency (CSA). From the MSC, Drs. Li, McFarlane, Polavarapu and Scinocca are involved as co-Investigators, and Drs. R. Ménard (ARQI), Y. Rochon (ARQX) and K. von Salzen (CCCma) are involved as Collaborators; together they represent four different MSC divisions across all three research branches. MSC provides considerable in-kind support of the GCC project, consisting of the time of its scientists as well as supercomputing time on the MSC computing system. MSC also provided cash support through its Climate Research Network during the first two years of the project. Since the phase-out of the CRN and its replacement by CFCAS funding, NSERC has regarded the CFCAS funding as part of our partner funding.

To supplement the interactions at our thrice-yearly Scientific Steering Committee meetings and annual workshops, the university-based RAs in our project have had the opportunity to spend extended periods of time at the MSC (CCCma) lab in Victoria. RAs C. McLandress, D. Plummer, S.R. Beagley, and V.I. Fomichev have all visited Victoria. Toronto-based S. Ren, Y. Yang and D. Sankey spend significant amounts of their time each week at the MSC (ARMA) lab in Toronto, including a biweekly meeting of the CMAM data assimilation subgroup (Task V) attended by Ren, Yang, Sankey from the university side, and by Rochon and Polavarapu from the MSC side. This CMAM data assimilation subgroup receives guidance from an Advisory Committee consisting of Shepherd and McConnell from the university side, and McFarlane, Ménard, and ARMA Chief D. Steenbergen from the MSC side, which meets three times per year.

CSA provides cash support for GCC. It has neither the capacity nor the mandate to conduct its own scientific research. However, CSA represents the key interface between GCGCC and the Canadian space-based atmospheric measurement community, and supports the Canadian space industry through the development of satellite instruments. Interaction wiwith the CSA occurs on an ongoing basis through the specification of our

workplan each year, by which we focus our efforts to most effectively meet the needs of CSA's space science program. We also participate in CSA workshops.

Value of the cash received from the partners during the period covered by this report (if any):

\$1,987,130

Value of the in-kind contributions received during the period covered by this report:

\$2,812,250

Describe the in-kind received:

Principally time on the MSC supercomputing system; also the time of MSC scientists involved in the project

b)							

Please provide detailed explanations for any deviation in the current period and in the budget for the coming year. (Note that deviations from the budget of greater than 20 per cent require preapproval from NSERC):

The salaries to others represent salaries paid to the research associates and assistants at the University of Toronto, York University, McGill University, Dalhousie University and the University of Victoria.

In several cases, investigators were either not able to find suitable graduate students, or those students were supported from scholarships, so the funds were used to hire postdocs. The overall salary costs are close to budget.

The annual costs don't necessarily balance the budget in any given year, because of carry-over between years. For example, the summer school was budgeted at \$15,000 in year 2.

The total conference travel budget for the project, including CFCAS support, is \$39,000 per year. However, to avoid the proliferation of numerous CFCAS sub-grants for travel alone, the travel is mainly charged to the NSERC account.

Actual expenditures for the current year are not available from the other universities, so columns 4 and 5 are quite incomplete.
