

# The impact of airborne wind and water vapour lidar measurements on ECMWF analyses and forecasts

Martin Weissmann, Andreas Dörnbrack,  
Gerhard Ehret, Christoph Kiemle, Roland Koch,  
Stephan Rahm, Oliver Reitebuch

*Institut für Physik der Atmosphäre, DLR Oberpfaffenhofen, Germany*

Carla Cardinali, Elias Holm

*European Centre for Medium-Range Weather Forecasts (ECMWF), Reading, UK*

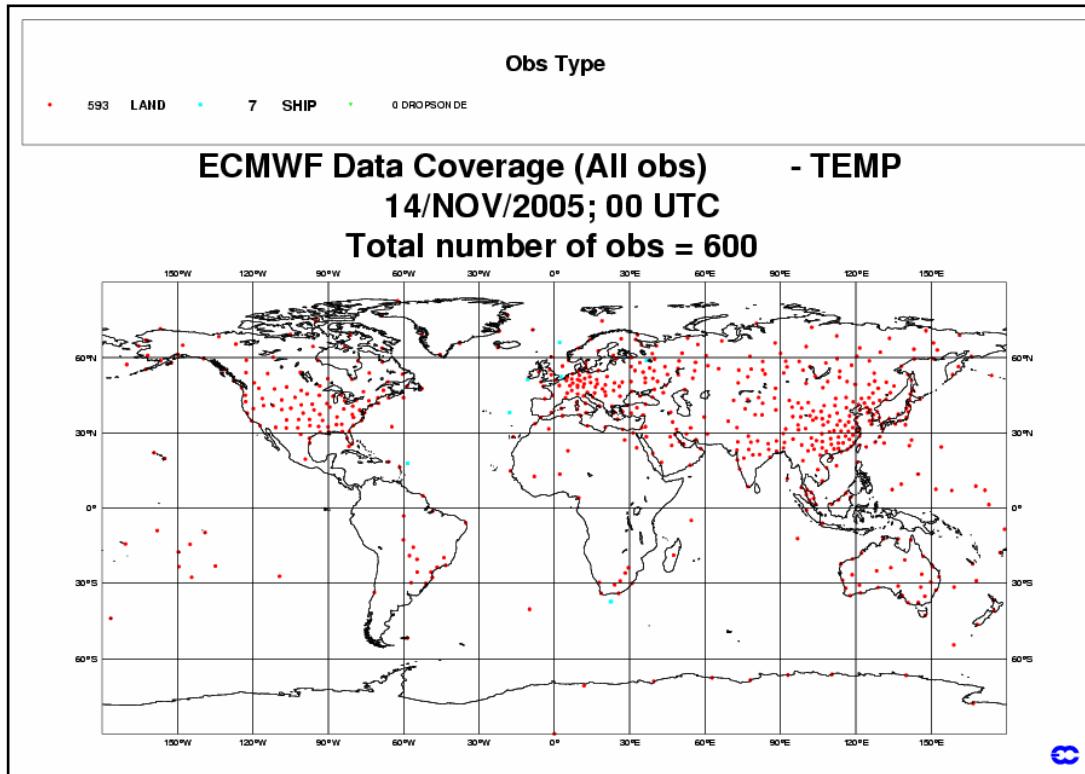

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

# Motivation

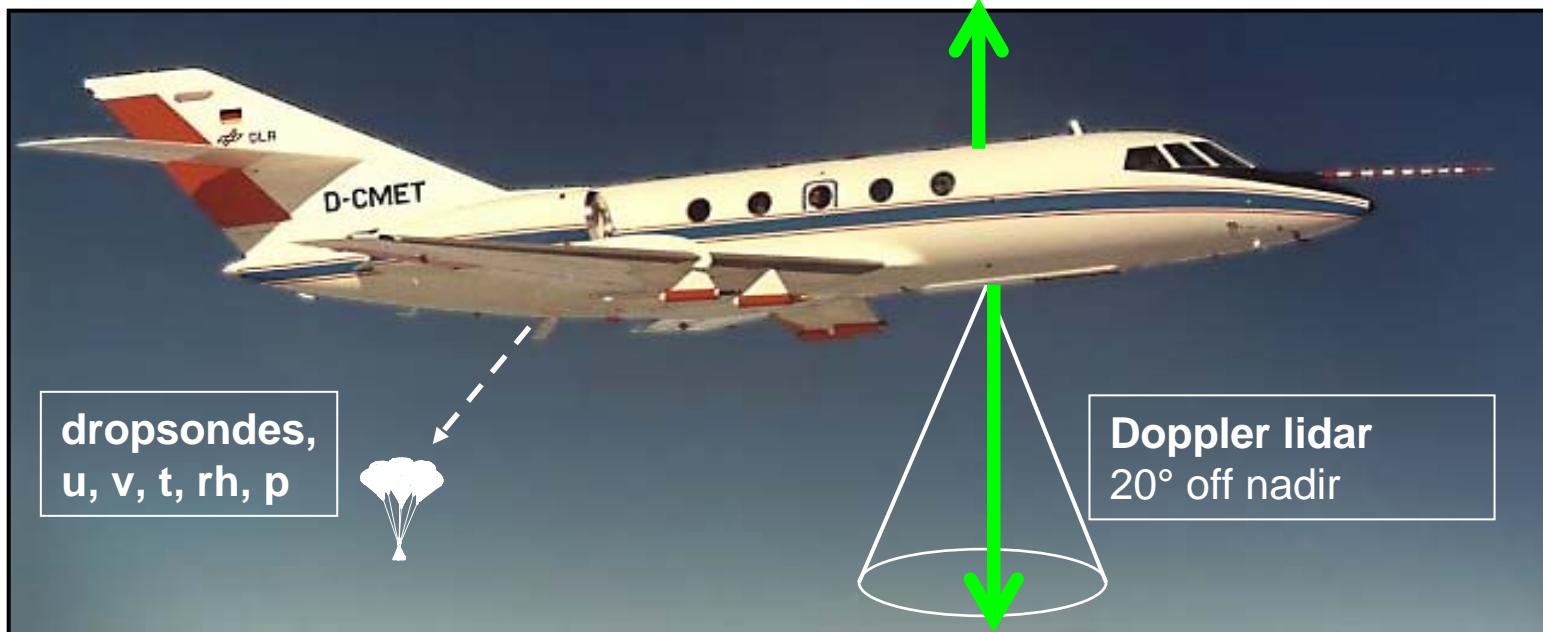

above oceans:  
hardly any radiosondes  
aircraft at cruise level  
low accuracy of passive instruments  
low resolution and height errors

lidars can measure various  
atmospheric quantities in remote  
regions with high accuracy and high  
resolution either from satellites or  
aircraft

goal: estimate benefit with impact  
studies

## DLR lidar instruments

Differential Absorption Lidar (DIAL)  
 $\lambda \sim 920\text{-}945 \text{ nm}$ , 100 Hz, 2 W  
parameter: water vapour molecule number  
nadir or zenith pointing  
horiz. resolution: 2 - 40 km  
vert. resolution: 500 - 2000 m

scanning coherent 2  $\mu\text{m}$  Doppler lidar:  
conical scans with 24 positions  
→ 24 LOS observations (~30/54 s)  
→ vertical profile of 3-D wind vector  
horiz. resolution 5 - 40 km  
vert. resolution 100 m  
range: 0.5-12 km

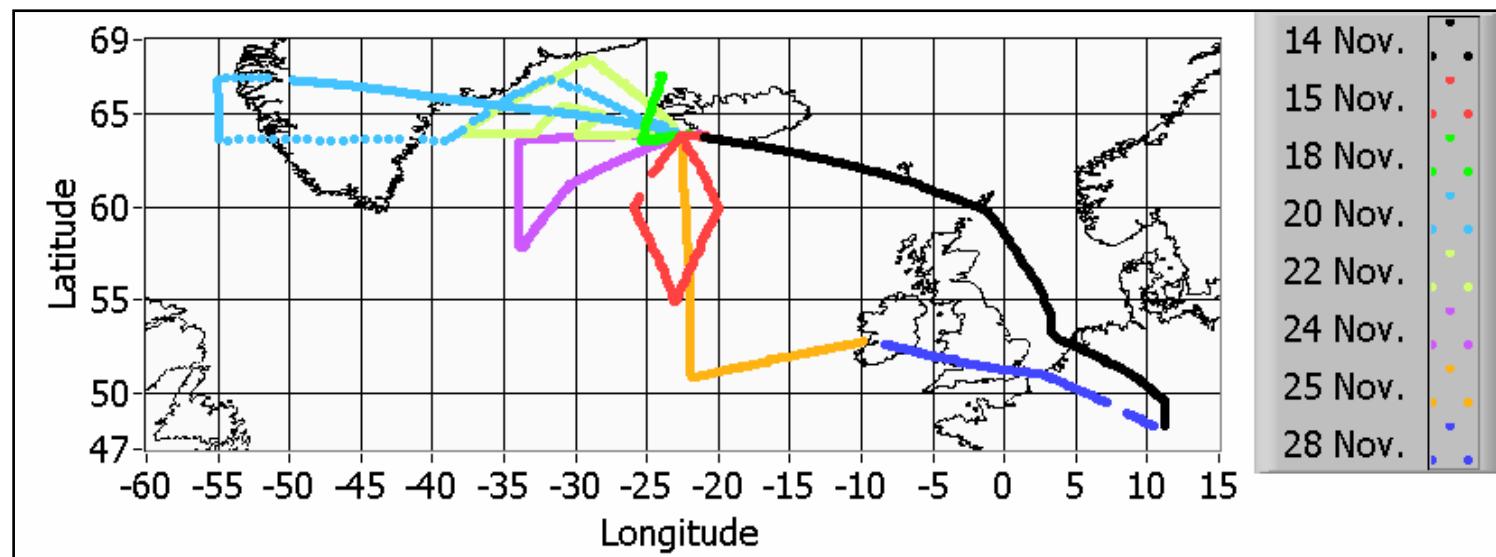

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

# Wind data - Atlantic THORPEX Regional Campaign (A-TReC)

## 14 - 28 November 2003

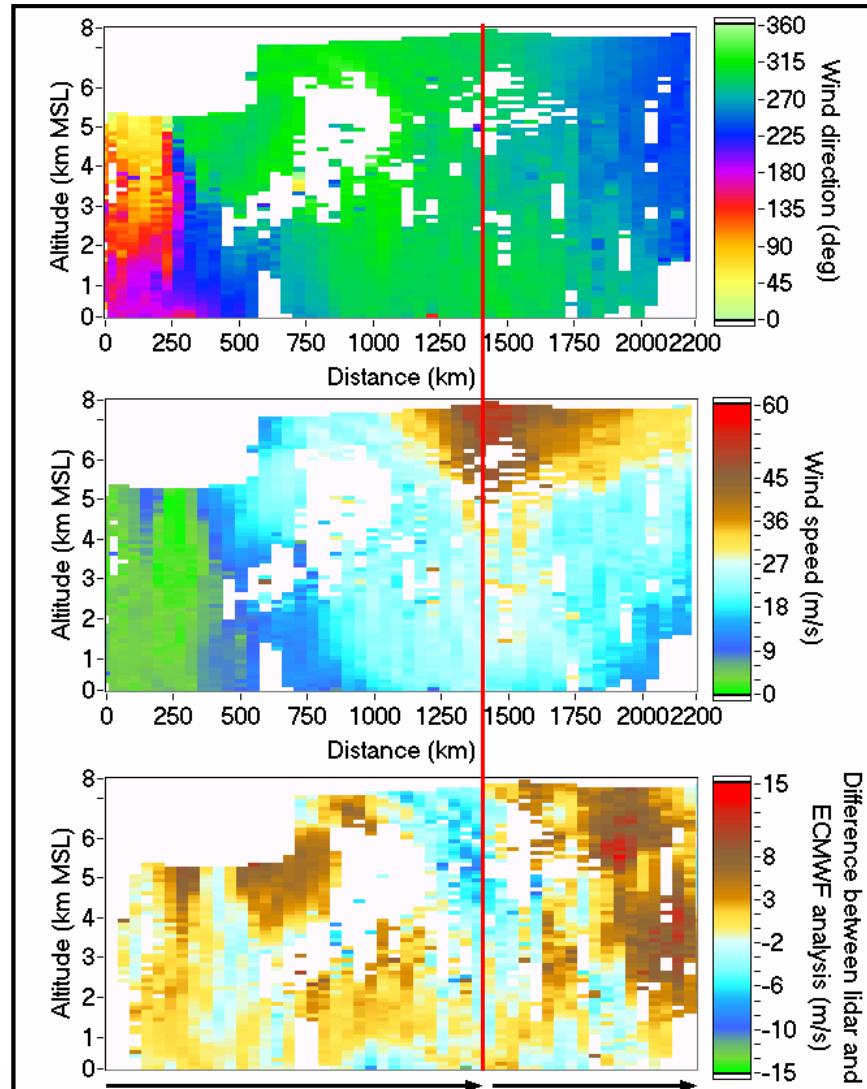

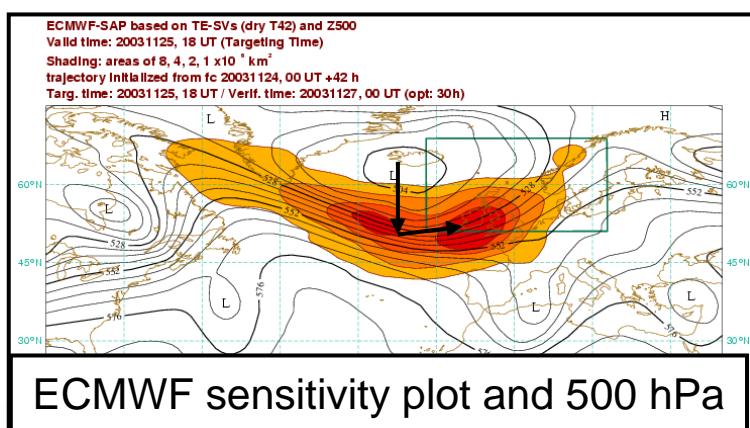

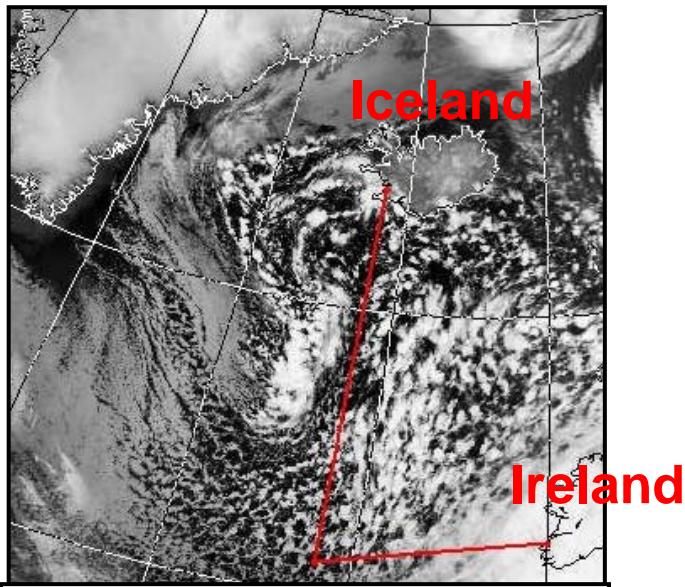

- 4 flights in "sensitive areas" (targeting)
  - 1 flight for Greenland Tip Jet
  - 1 flight for intercomparison ASAR and lidar
  - 2 transfer flights
- 

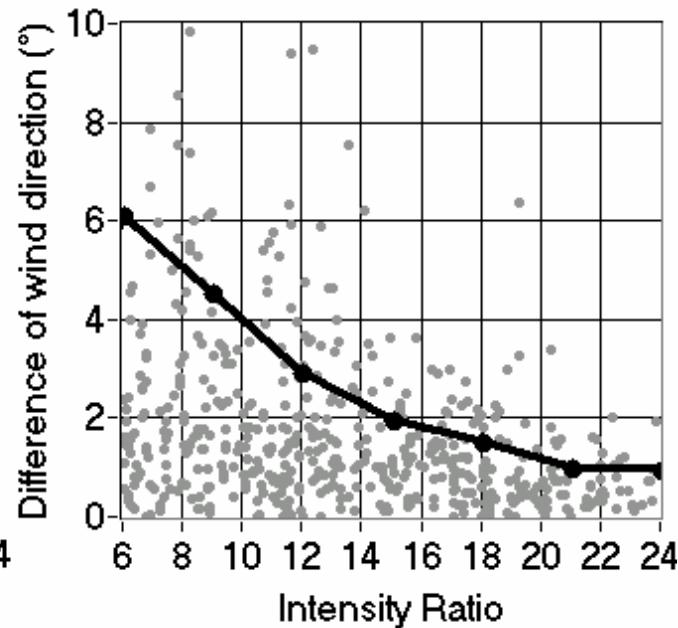

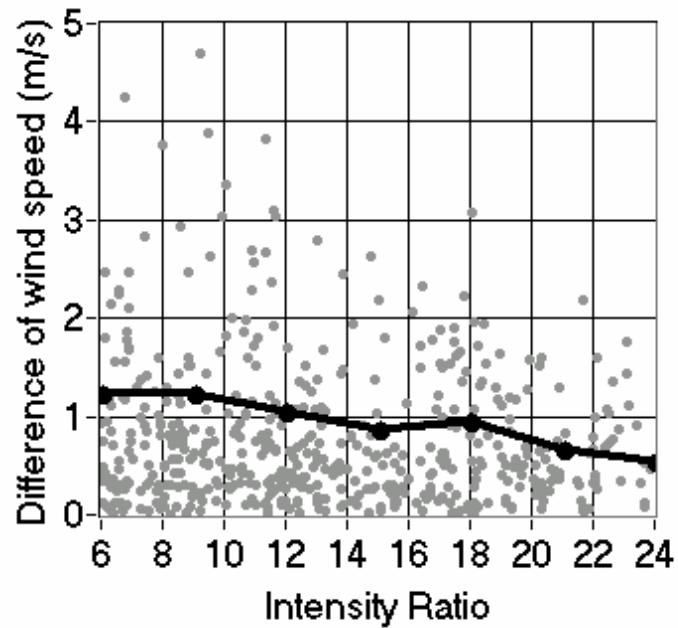

8 flights, 1600 wind profiles, 40 000 lidar measurements, 49 dropsondes

## Observations on 25 November 2003

# Statistical intercomparison of lidar and dropsonde winds

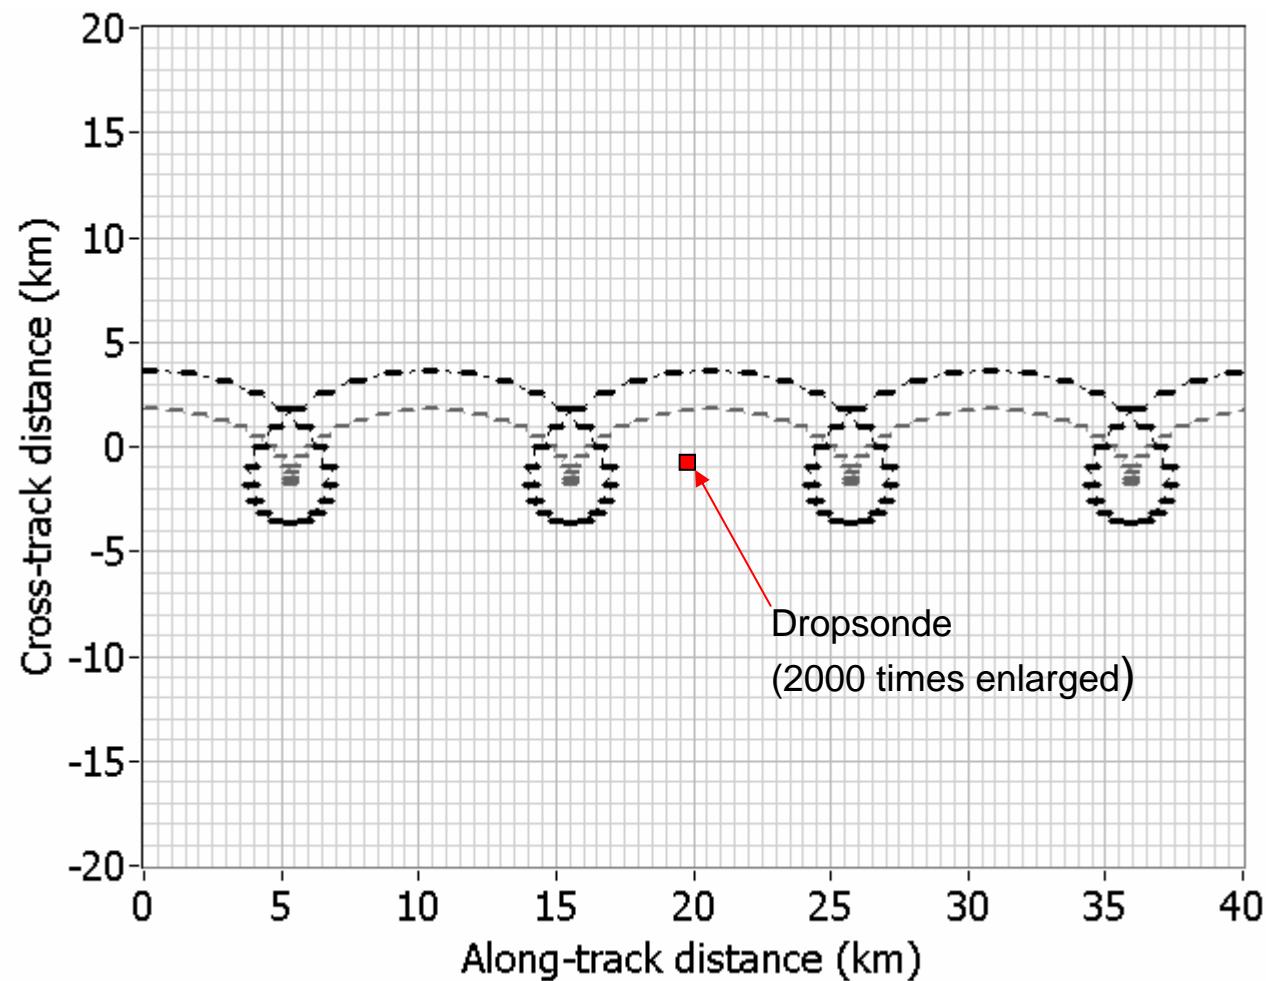

Comparison: 33 Wind profiles  
> 500 Measurements

**Error Lidar (u,v):  
RMS = 0.75-1 m/s**

## Assigned errors

Error lidar:  
0.75-1 m/s

Representativeness error  
(Frehlich & Sharman 2004)  
 $< 0.5$  m/s

Total error lidar:  
1-1.5 m/s

Total error  
Dropsonde/Radiosonde:  
2-3 m/s

Total error AMV  
2-5 m/s

## Experiments with ECMWF T511 global model

6 experiments 14-30 November 2003

lidar, ~10 km, Std = 1 m/s

lidar, ~40 km (2 averaging types), Std = 1 m/s

lidar, ~40 km, Std = 1.5 m/s

~100 dropsondes (from 10 flights)

control run

thinning to grid points (40 x 40 km, 60 levels)

~ 80% not used

~ 3000 used measurements

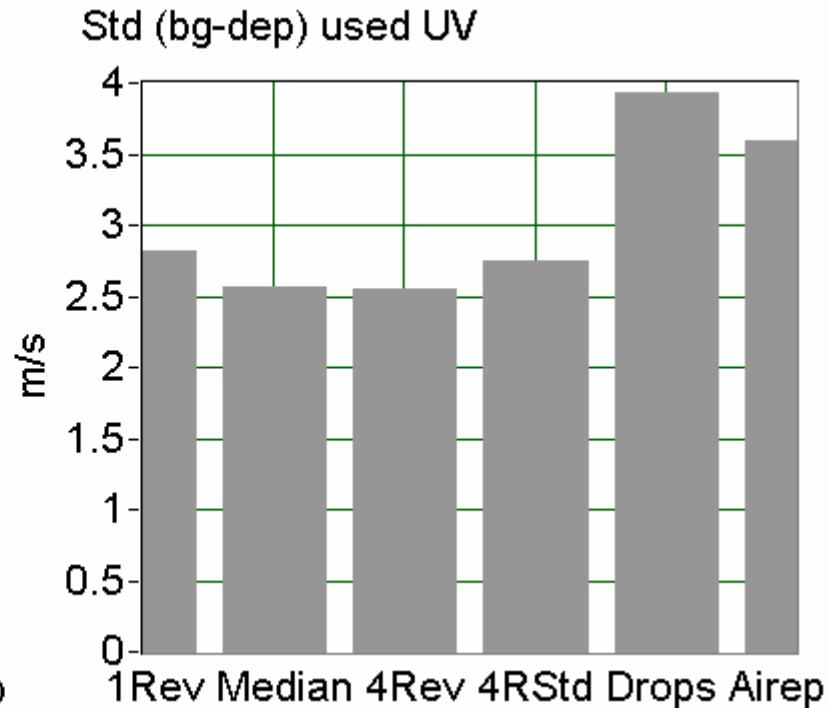

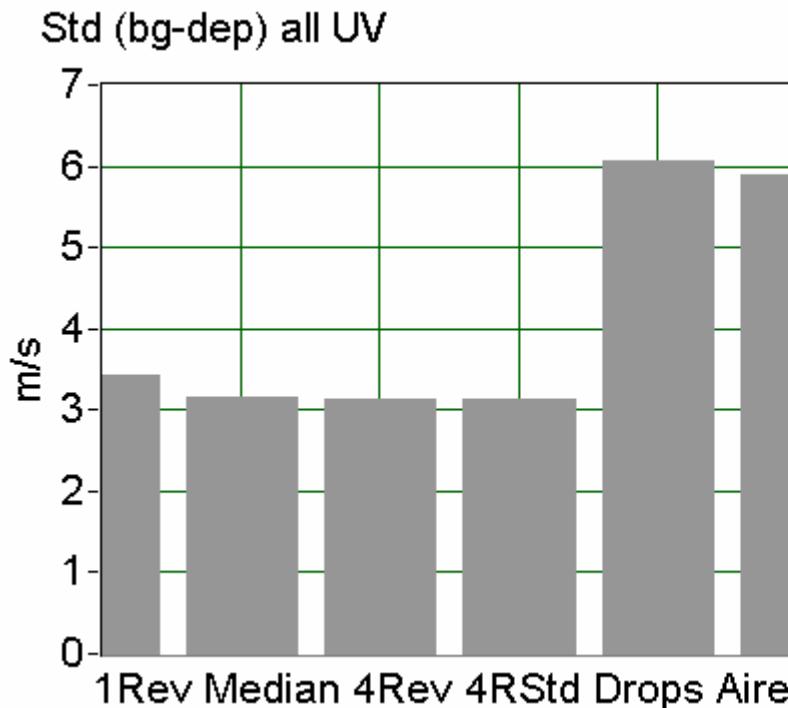

5 million operational measurements used per day

lidar = 0.005% additional measurements

4 un-cycled experiments to investigate targeted observations (forecast sensitivity)

## Background departures

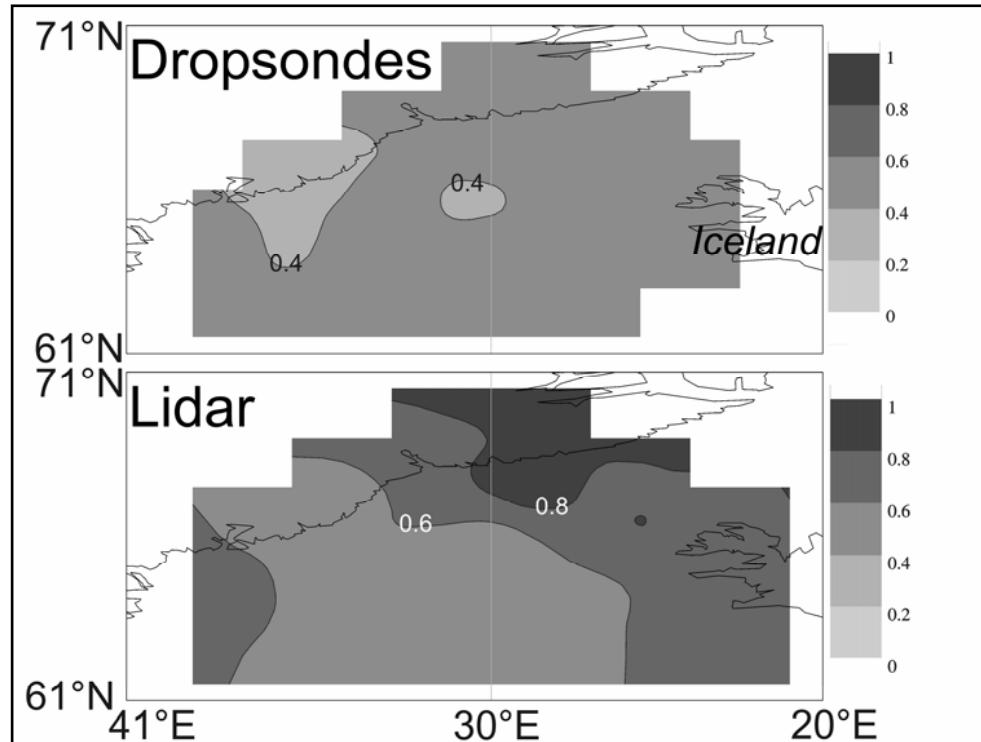

Background departure = difference background and observation

$$(\text{Std(bg-dep)})^2 = (\text{Std}_{\text{obs}})^2 + (\text{Std}_{\text{bg}})^2$$

## Observation influence (22 November 2003)

	Lidar u, v	Dropsonde u, v
Observation influence	0.63	0.45
Number of observations	758	388
Information content	477.5	174.6

observation influence (Cardinali et al. 2004):

0 --> no influence of observations

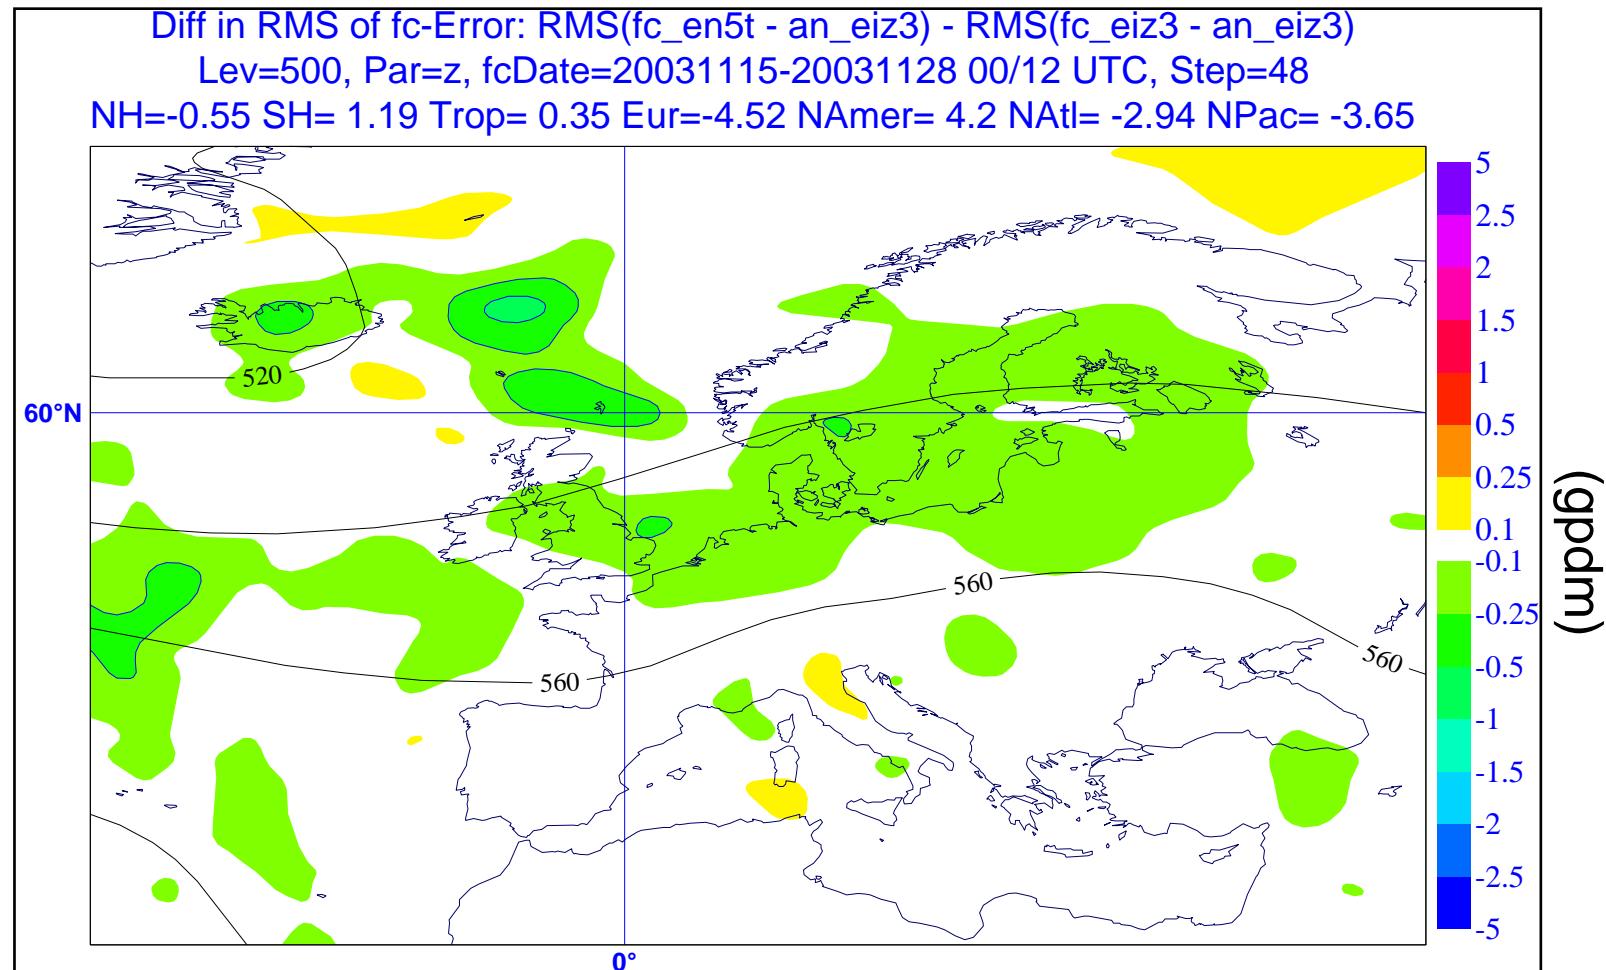

1 --> no influence of background

mean global observation influence = 0.15

## Reduction of forecast error at 500 hPa - 48 h

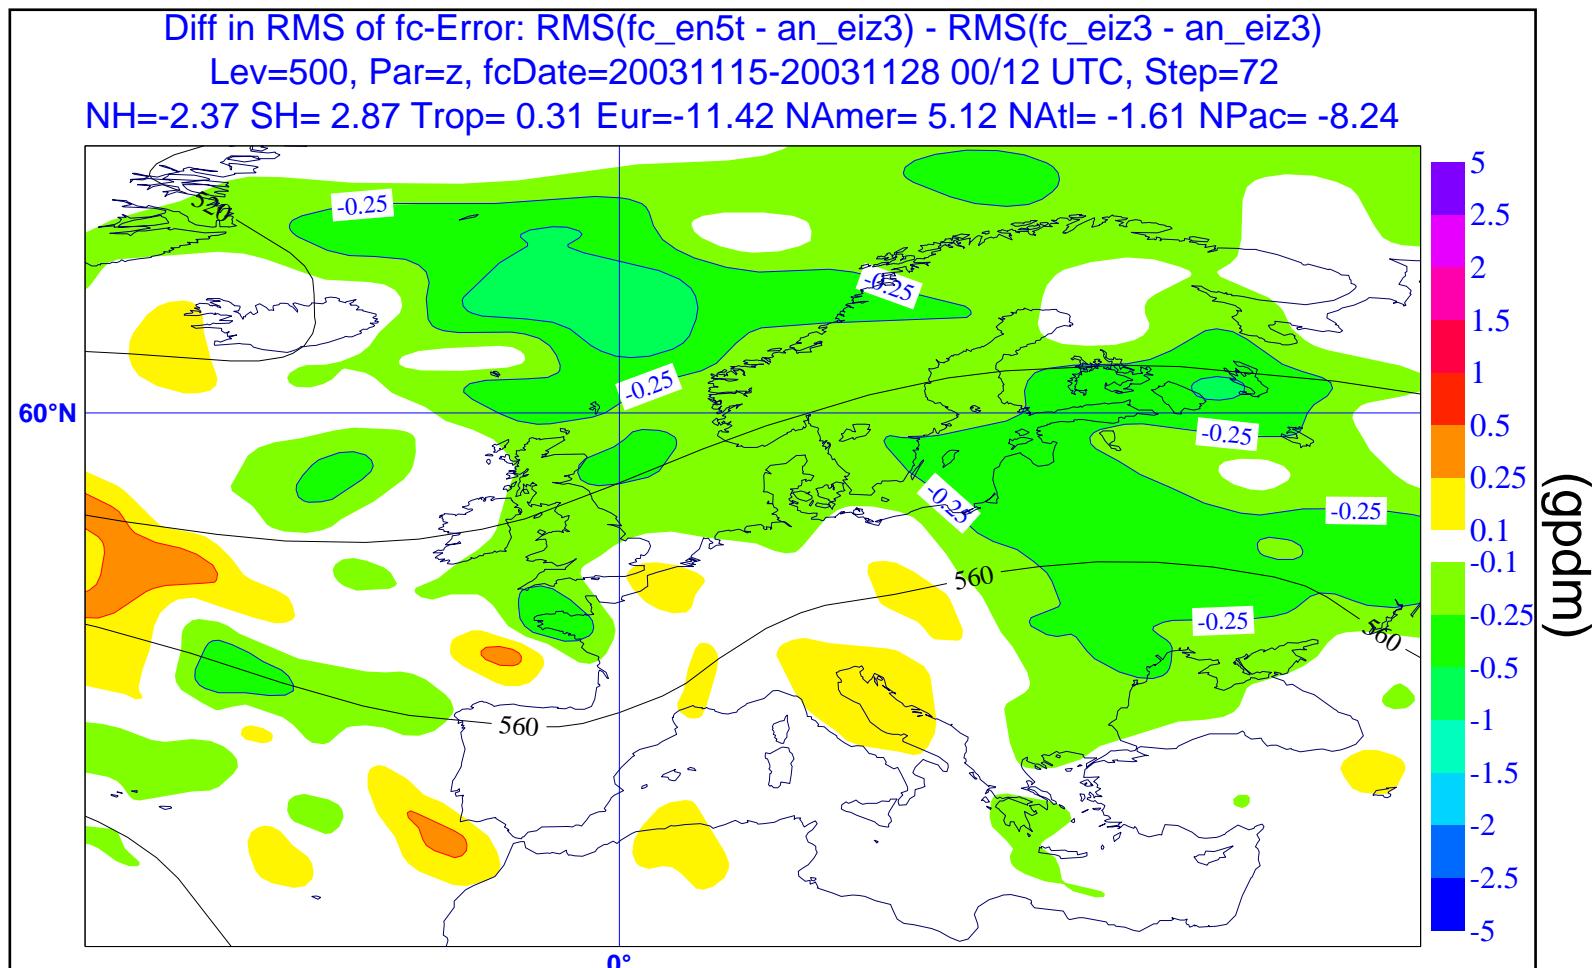

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

## Reduction of forecast error at 500 hPa - 72 h

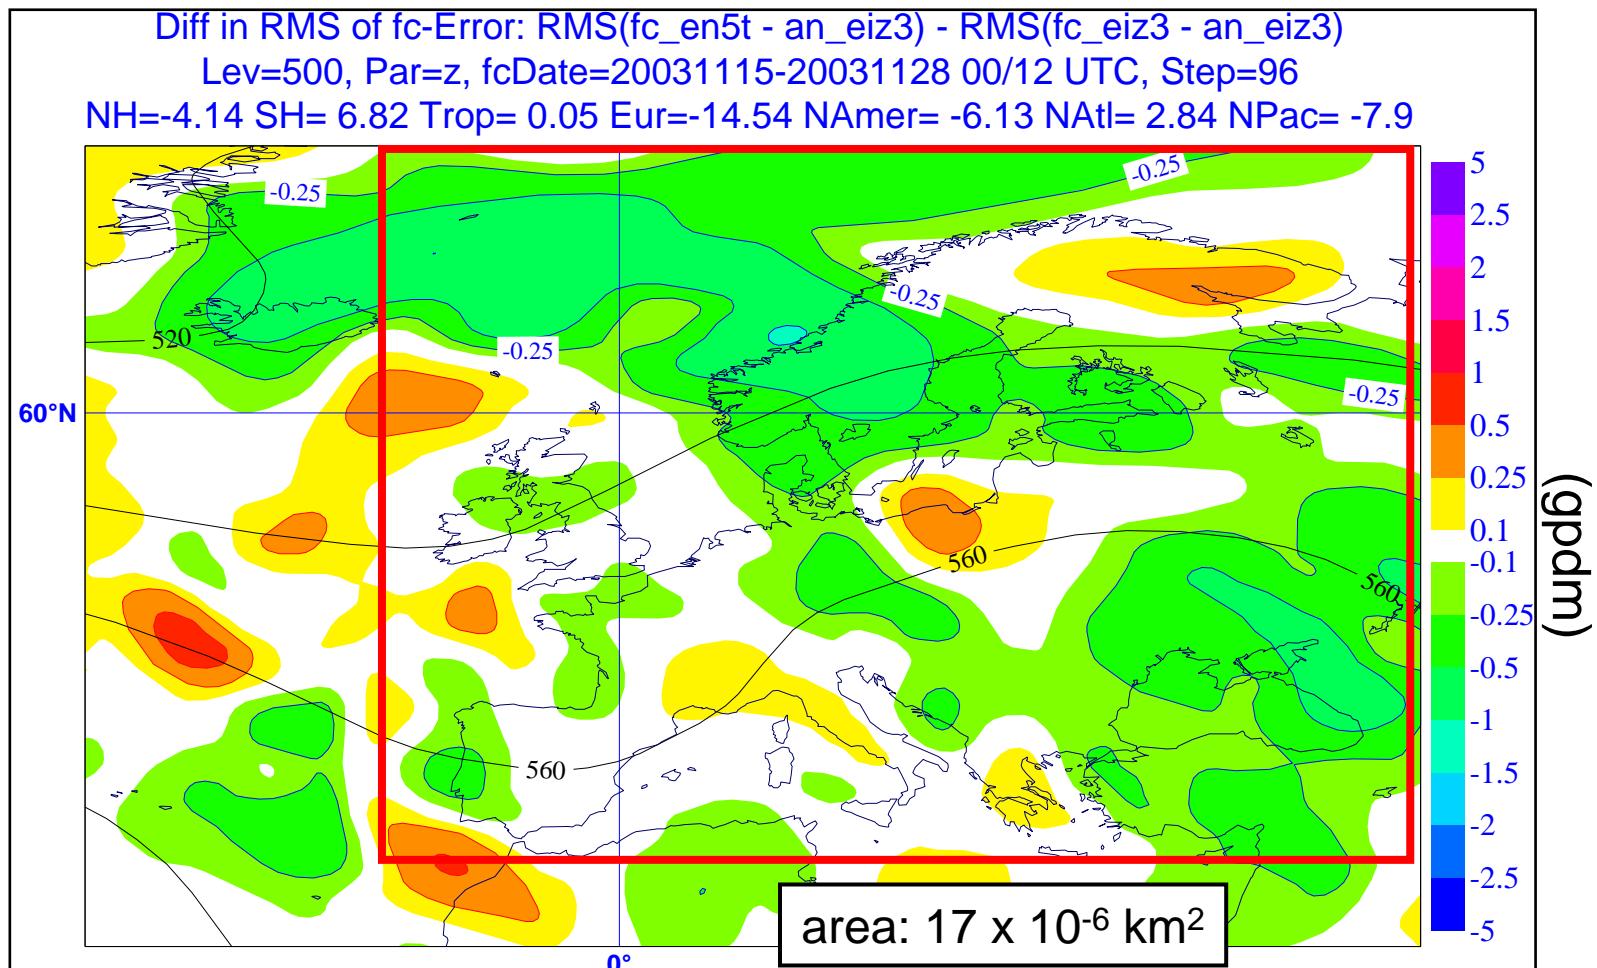

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

## Reduction of forecast error at 500 hPa - 96 h

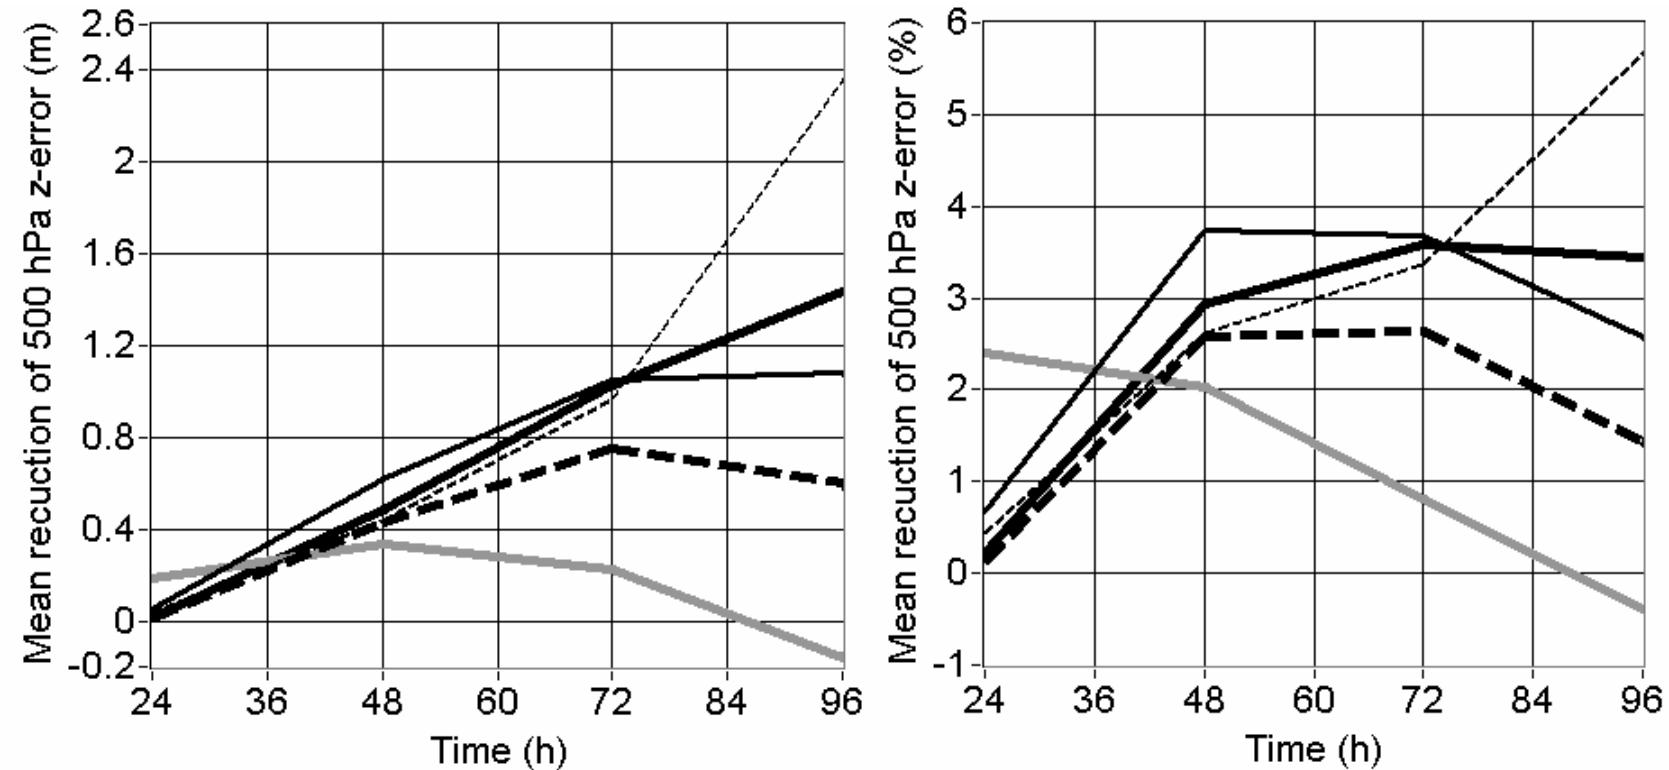

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

## Reduction of forecast error - 500 hPa

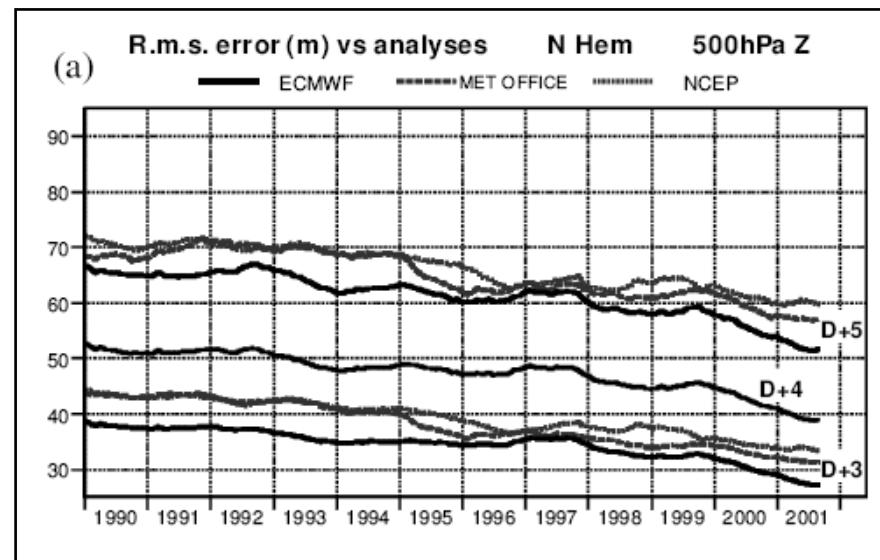

Mean reduction over Europe, averaged over 29 forecasts (2 weeks)  
black: experiments with lidar, gray: experiment with 100 dropsondes

## Comparison to mean reduction of NWP error

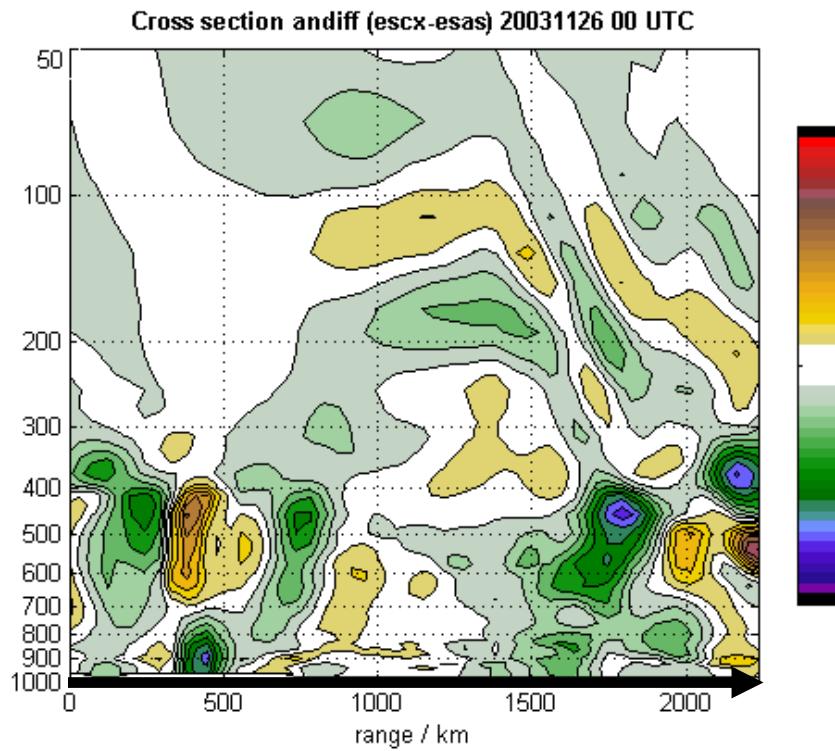

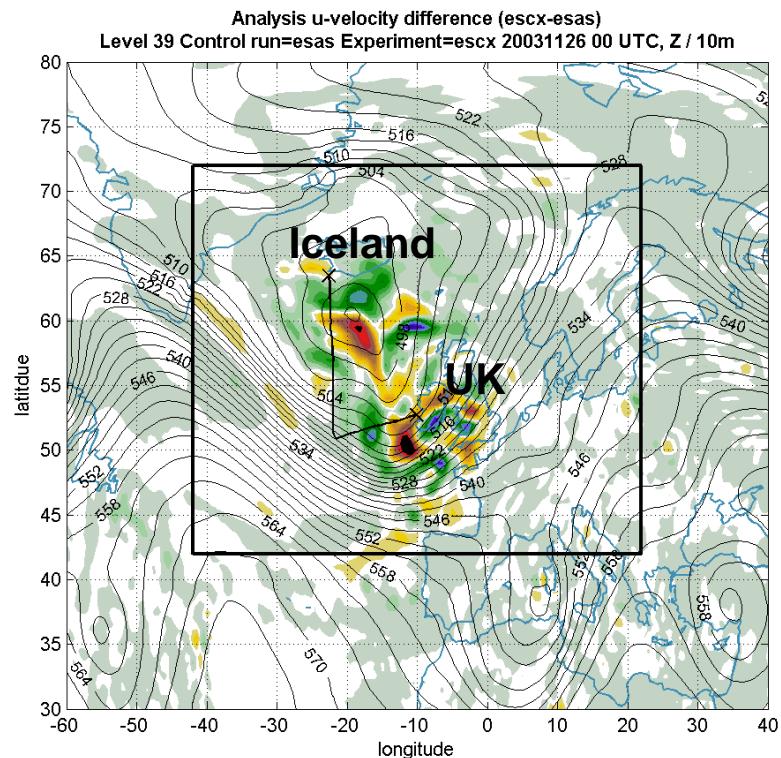

Reduction of forecast error of 500 hPa geopotential height:  
Lidar 72 h: ~ 1 m (3.5%)

Simmons and Hollingsworth 2002:  
72 h: 10 m in 10 years

## Analysis influence of lidar data

Analysis difference of lidar experiment and control run  
26 November 2003, 00 UTC

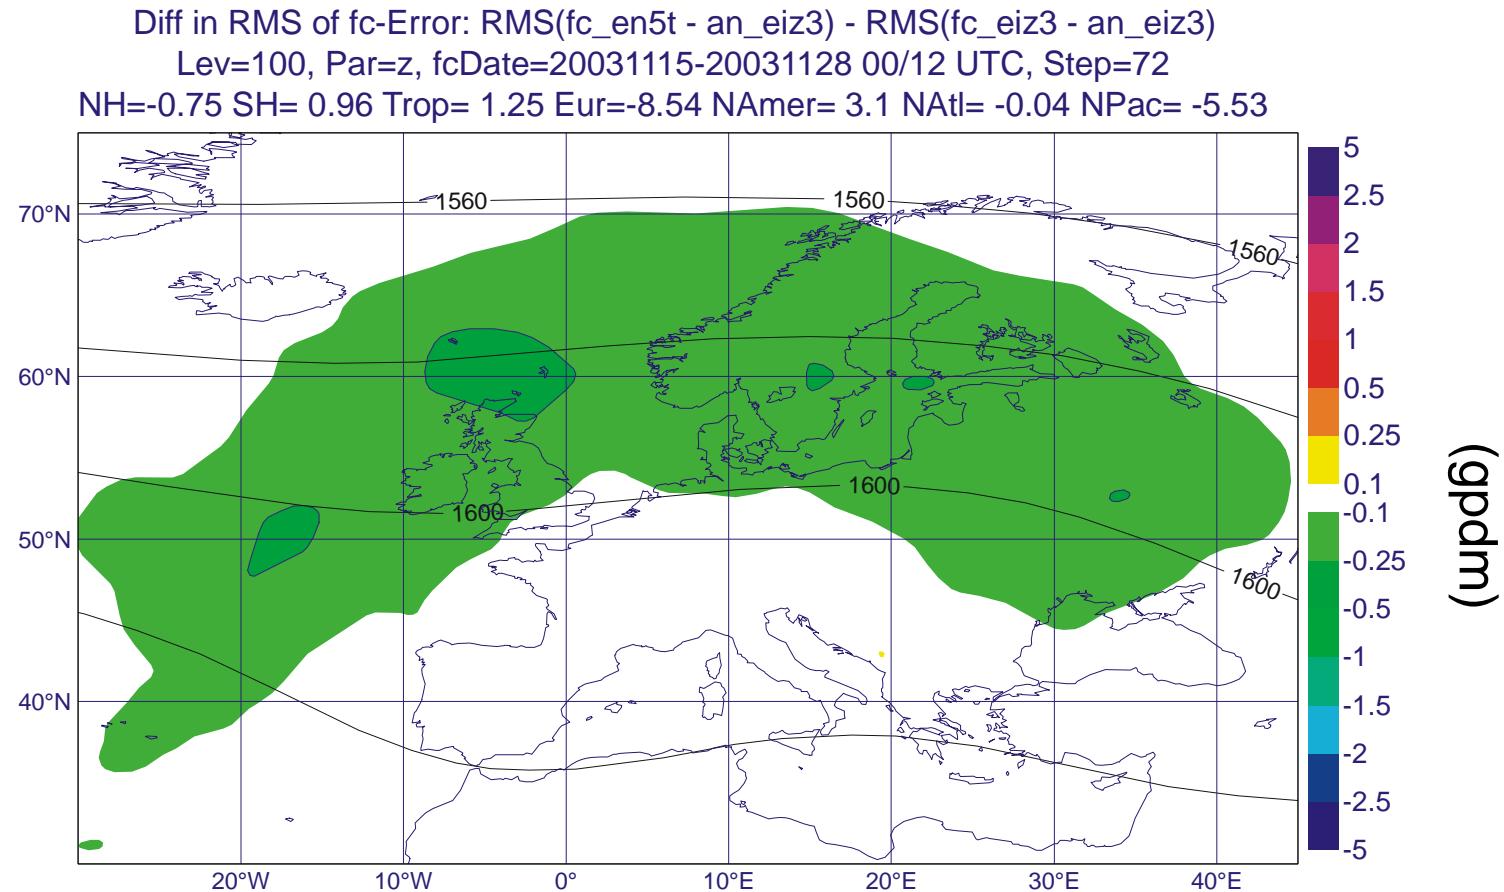

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

## Reduction of forecast error at 100 hPa - 72 h

highest lidar observations at 250-300 hPa

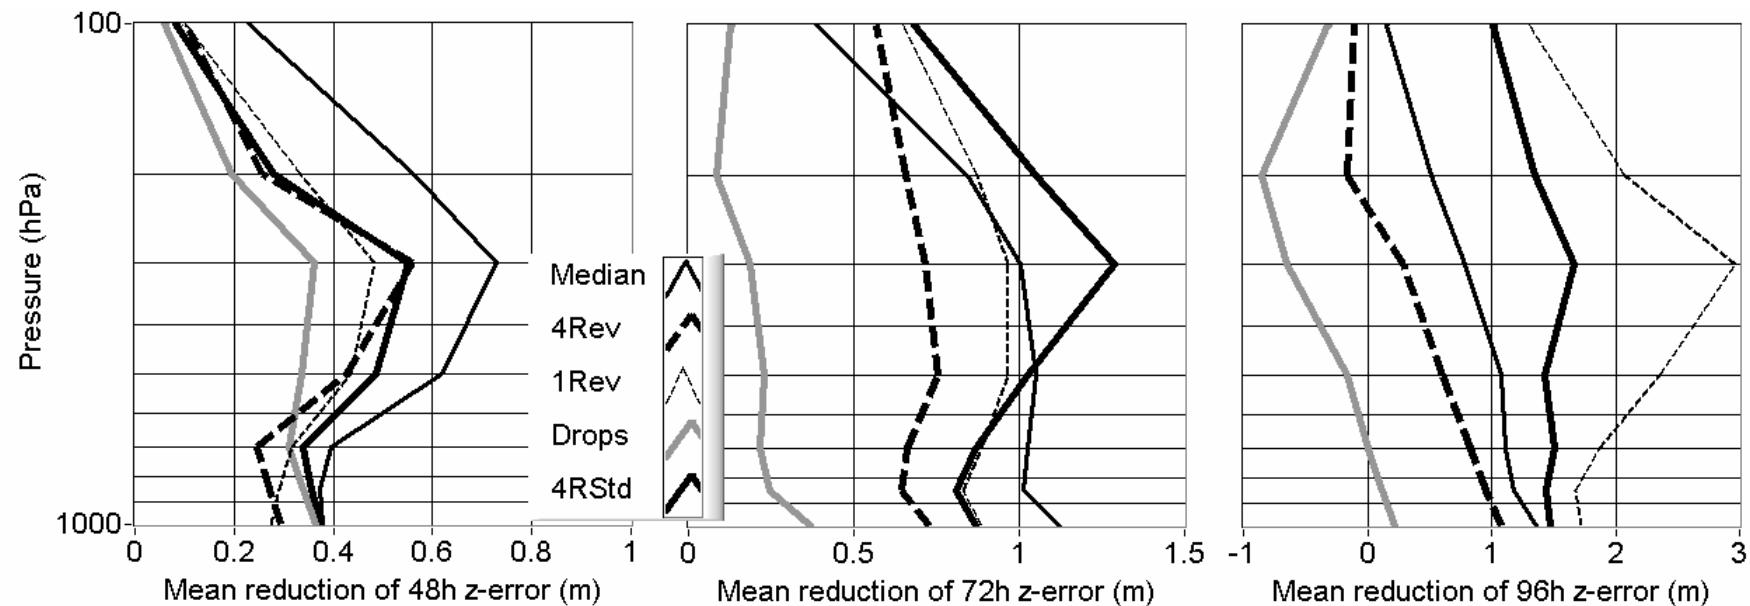

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

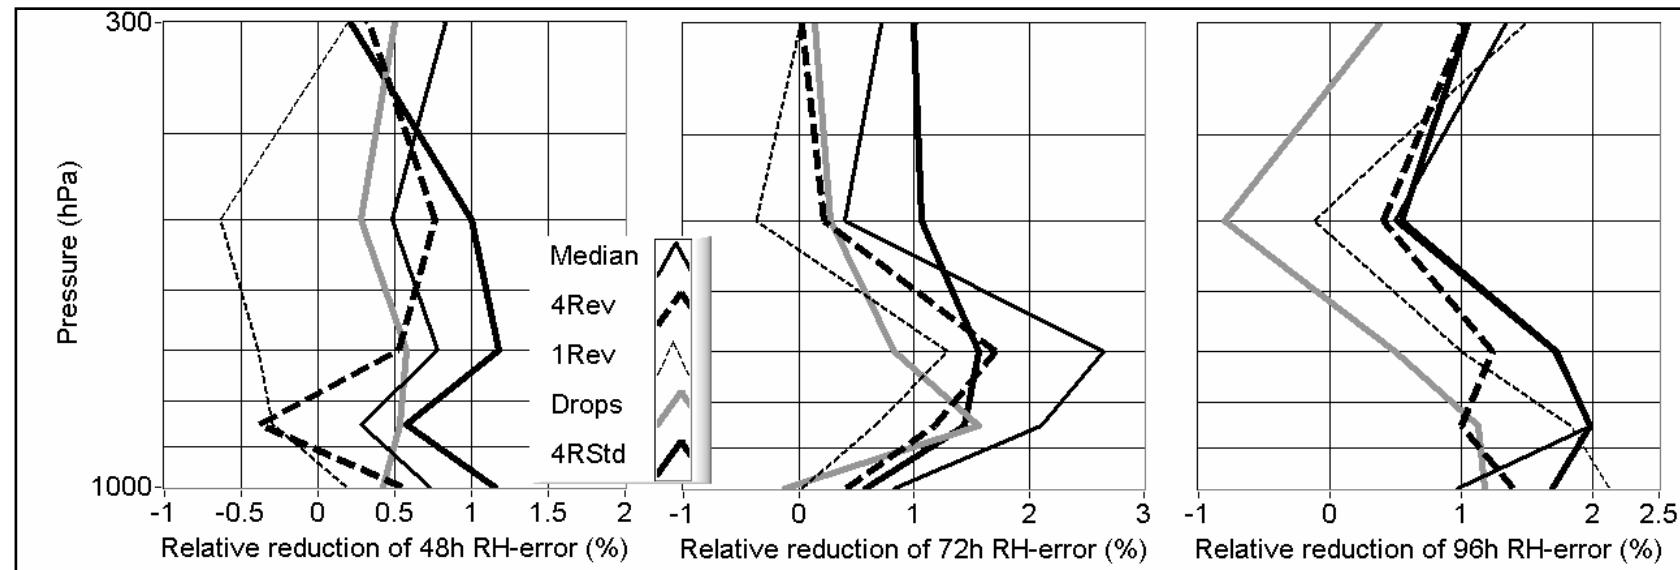

## Reduction of forecast error - 48, 72, 96 h

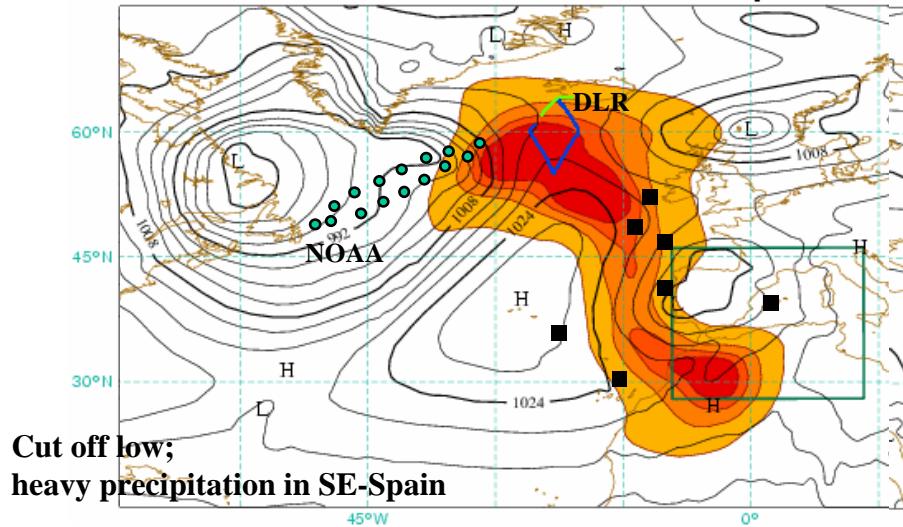

## Relative reduction of RH forecast error - 48, 72, 96 h

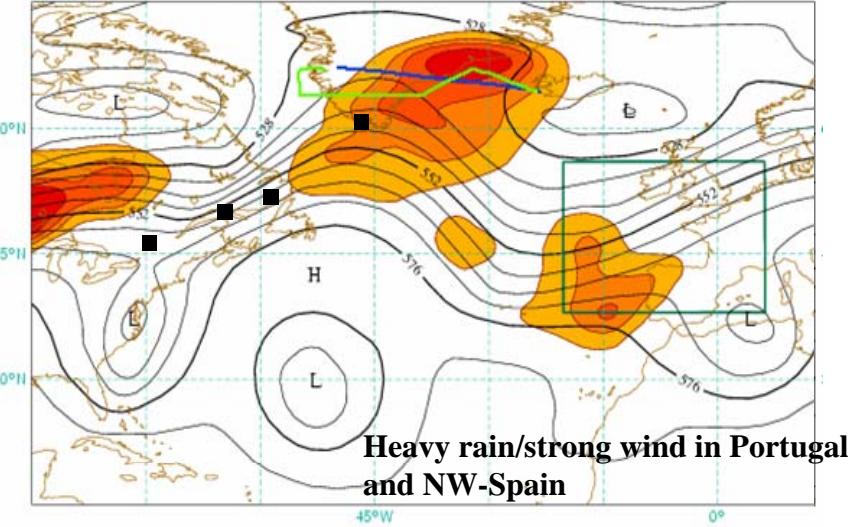

→ Reduction of u, v, z, rh, and t forecast errors

# A-TReC targeting campaigns

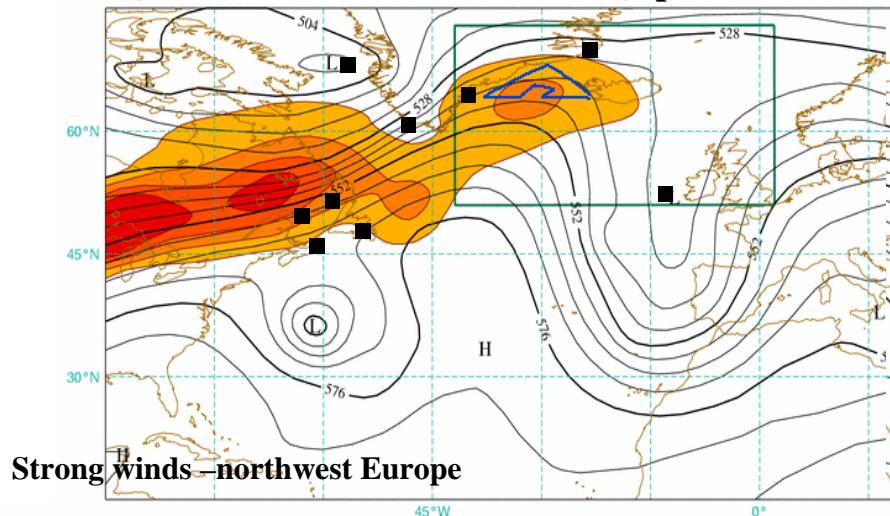

20031115 at 18 Step42

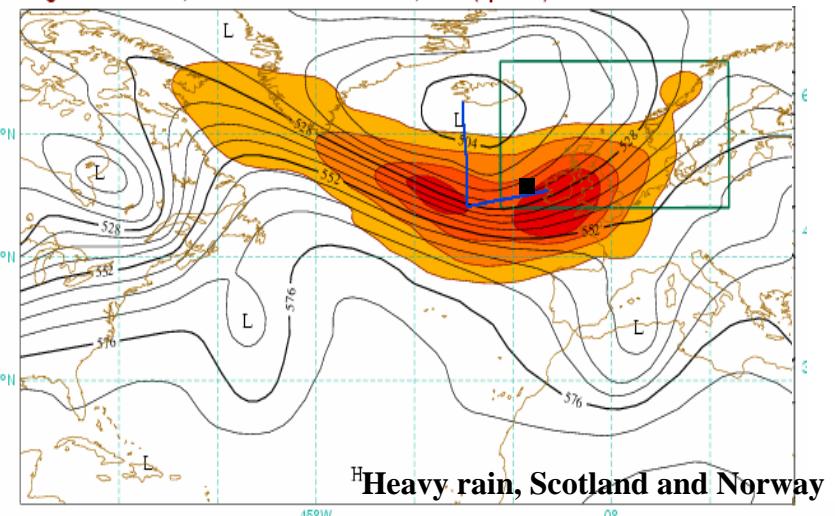

20031120 at 18 Step54

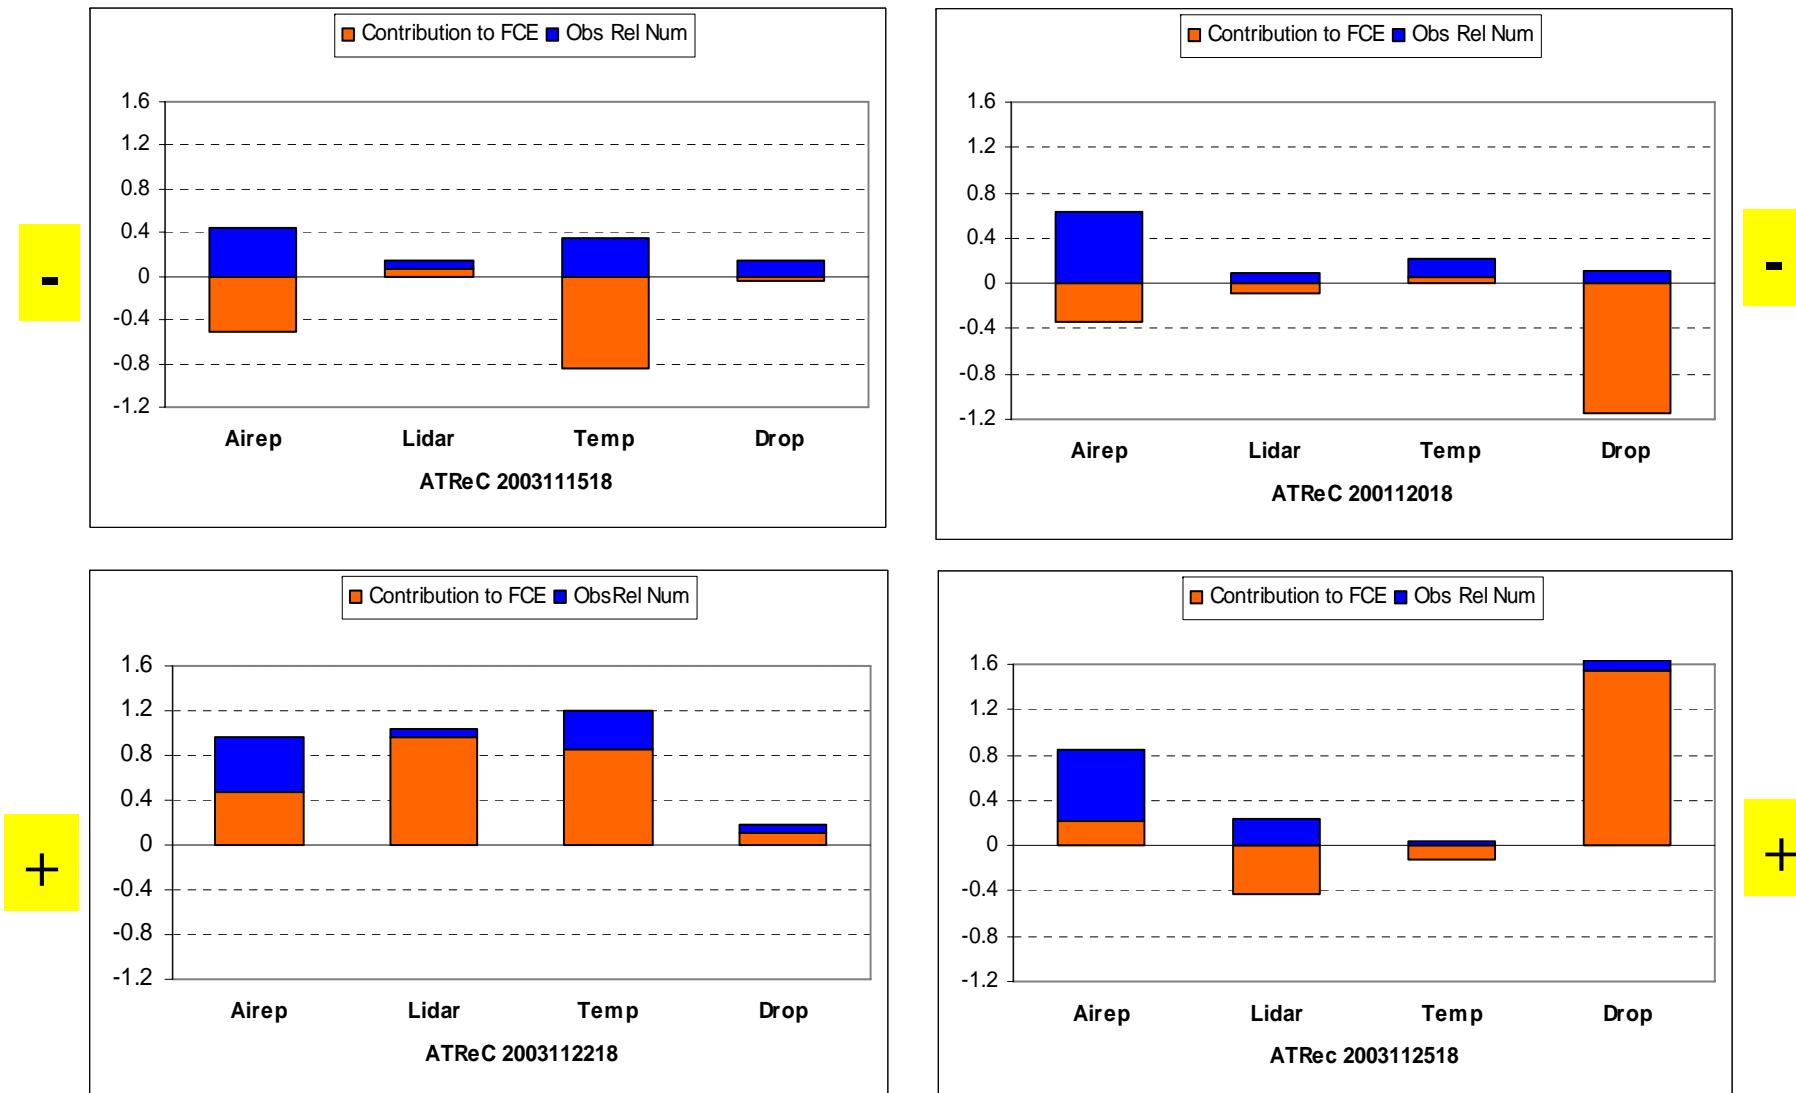

20031122 at 18 Step66

20031125 at 18 Step30

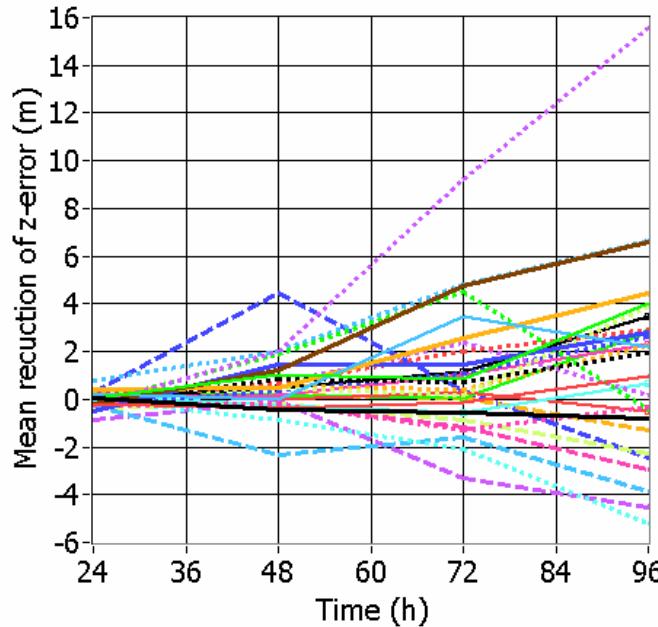

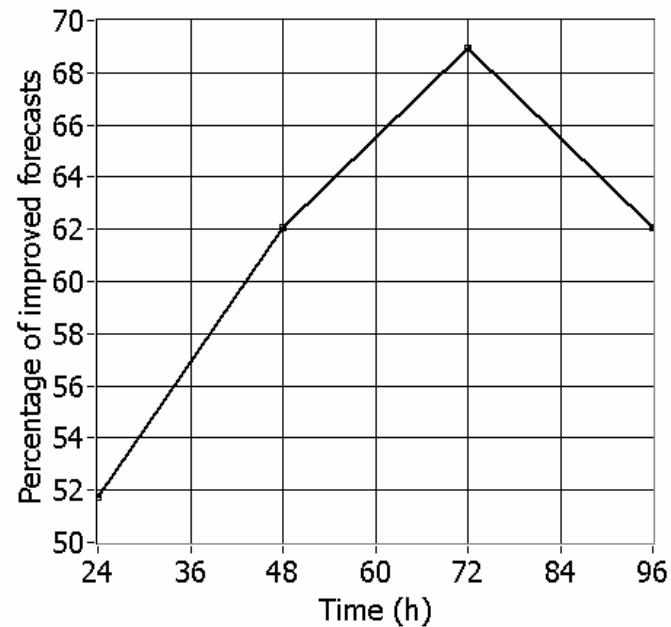

# The influence of targeted observations

## The problem of case studies ...

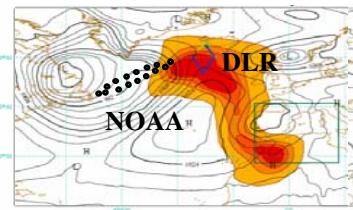

28 forecasts  
14-28 November

statistical problem --> larger sample  
practical restrictions --> better planning

# Impact outside the verification area

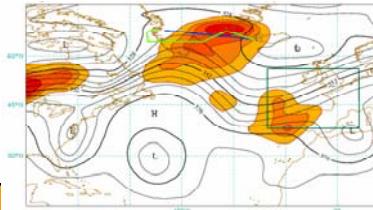

2003111518 Step42

28	20	15
7	14	4
3	7	2

2003112018 Step 54

15	13	9
8	27	8
7	10	2

9	18	25
10	10	10

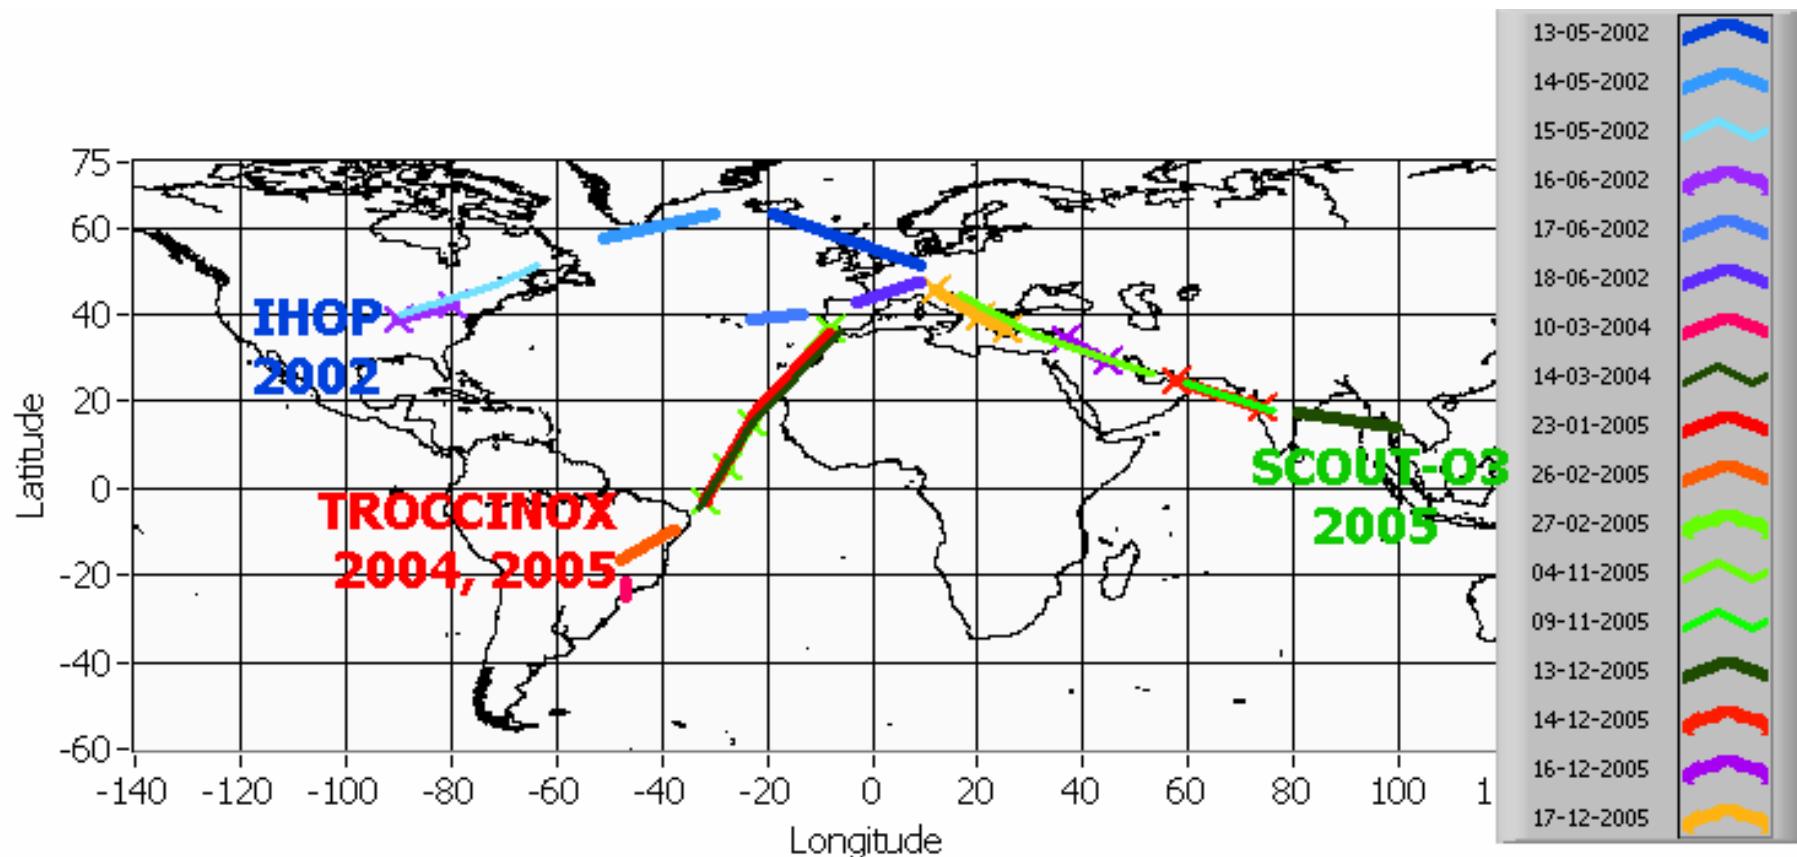

8	13	6
8	37	5

impact outside of verification area --> larger areas  
improved sensitivity predictions - Kalman Filter  
no compromise between sensitive areas calculated by different models

## DIAL lidar water vapour observations

Transfer flights to 4 field campaigns during 2002 - 2005

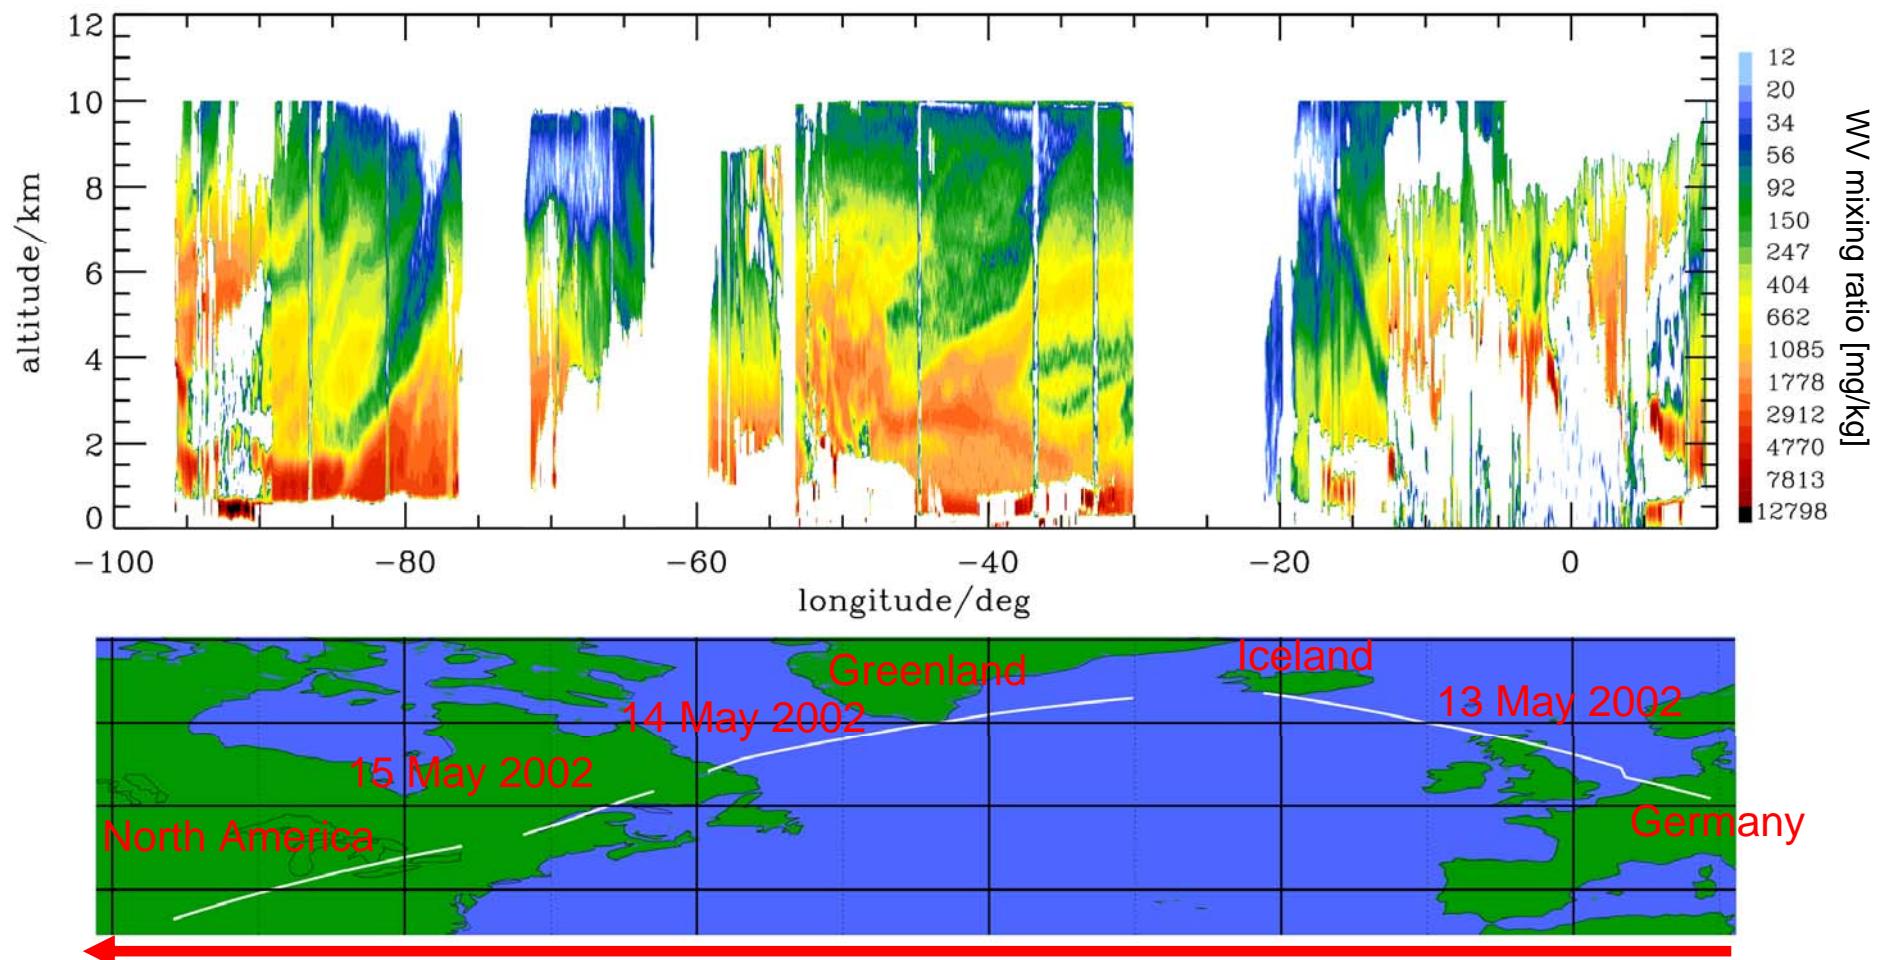

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

## Transfer Germany --> Oklahoma, IHOP 2002

Flentje et al. 2005

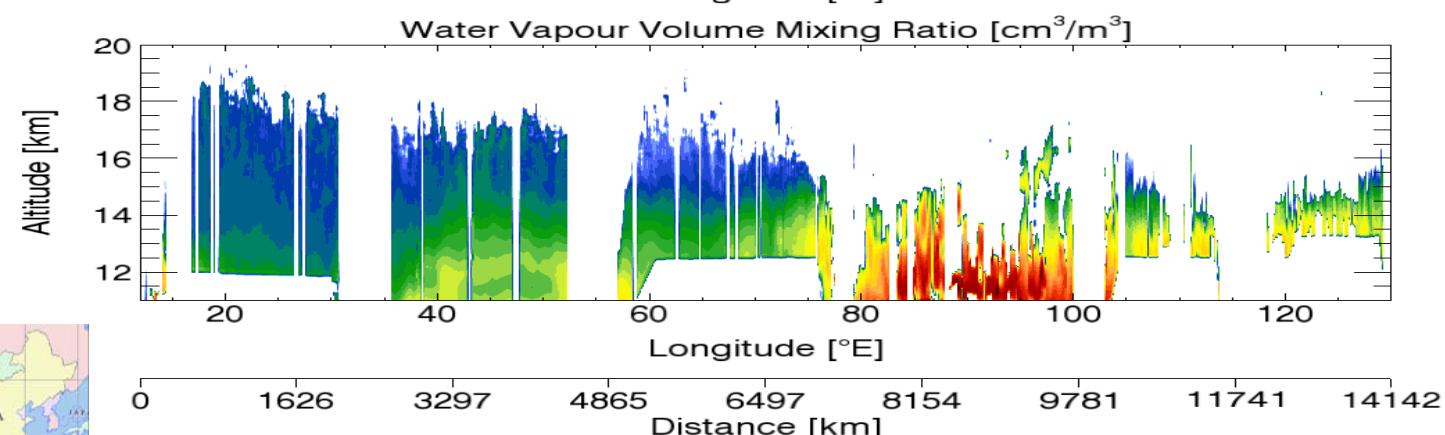

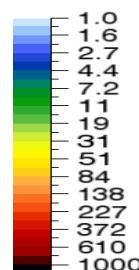

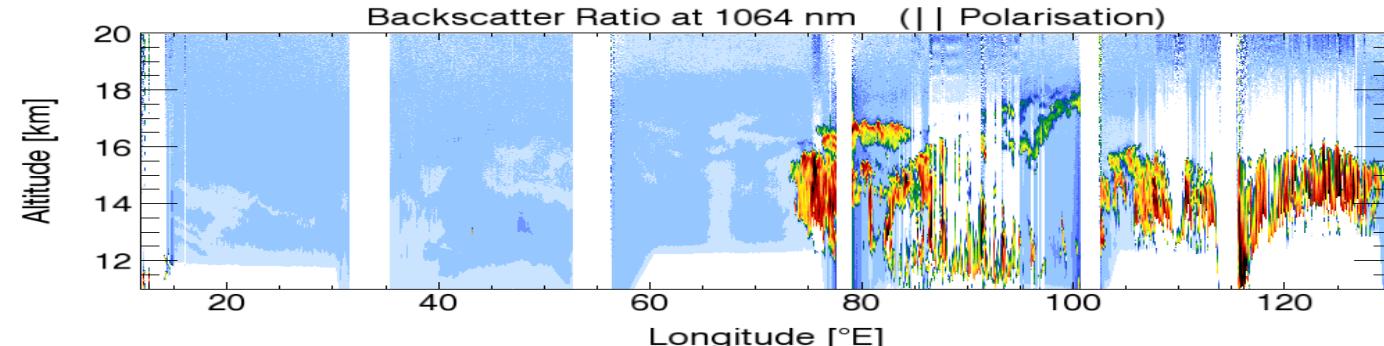

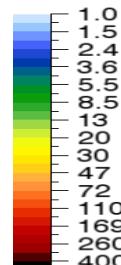

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

# Stratospheric DIAL observations

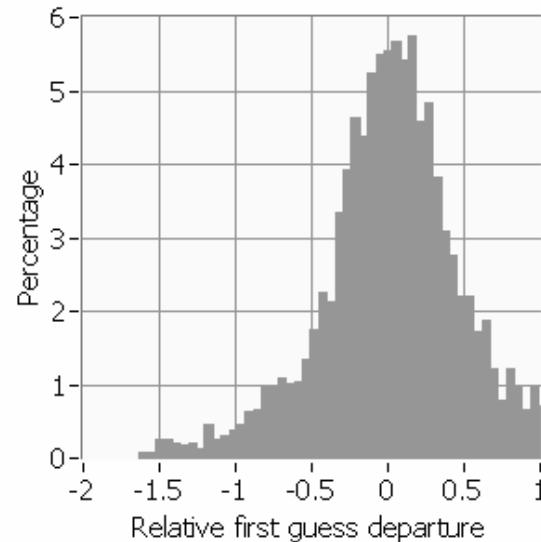

Deutsches Zentrum  
für Luft- und Raumfahrt e.V.  
in der Helmholtz-Gemeinschaft

SPARC Data Assimilation Workshop, Noordwijk 3 October 2006

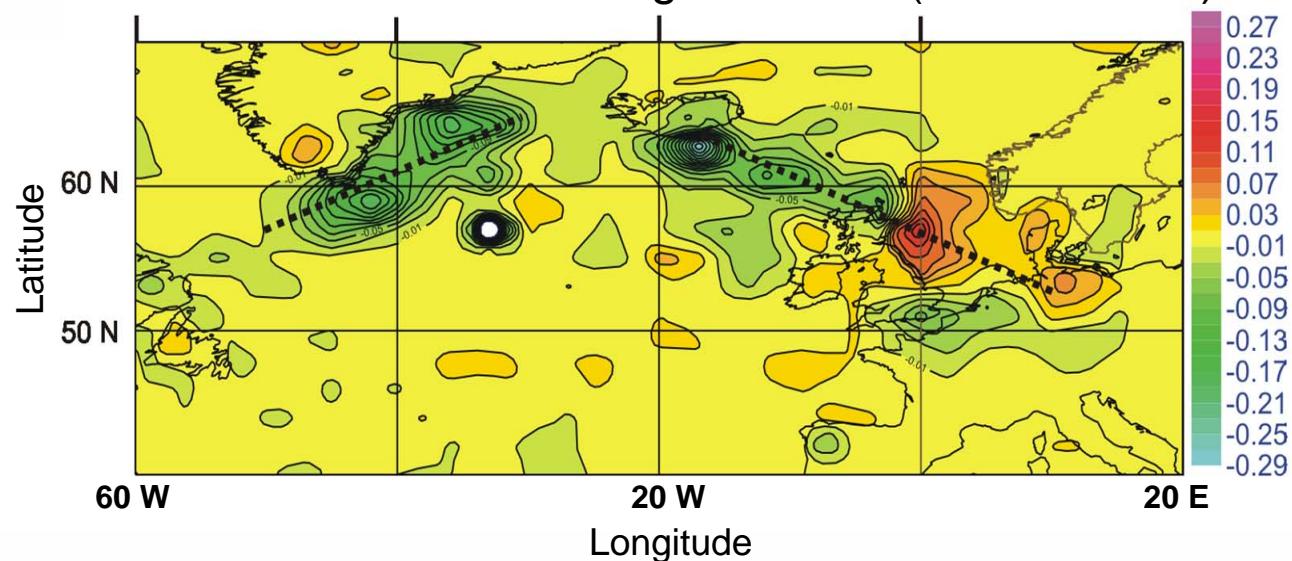

## Impact of lidar H<sub>2</sub>O-observations (preliminary)

Assigned errors: 4 - 10%

Mean relative background departure:  
2400 observations  
Std = 44%  
Bias < 1%

Reduction of TCWV first guess error (lidar - control)

## Conclusions

first assimilation of "real" Doppler lidar measurements in global NWP model

lidar measurements have a smaller error than all other operational wind observations  
--> analysis influence is 50% higher than that of dropsonde obs.  
information content is three times higher

lidar wind measurements reduce the average forecast error of u, v, z, rh, and t over Europe  
average reduction of the 48 - 96h forecast error over Europe ~3%

propagation of the information into the lower stratosphere through 4D-Var

limitations of targeted observations  
need for more cases, larger verification area, systematic decisions

ongoing water vapour studies

emphasizes the potential airborne and spaceborne lidars (ADM-Aeolus, possible future water vapour DIAL satellite)

future campaigns: COPS 2007, IPY 2008, T-PARC 2008

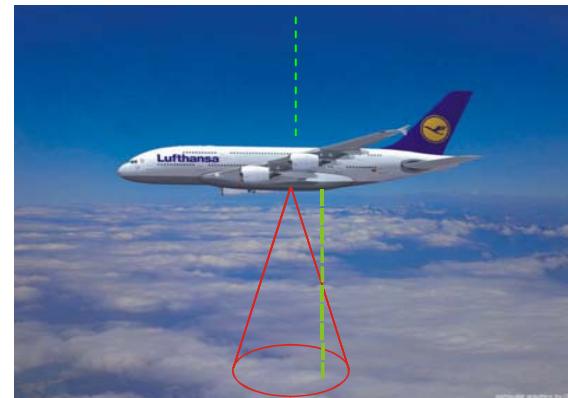

## Cost estimates

ADM-Aeolus

launch: 2009  
300 Mio. Euros for 3 years  
3000 LOS-profiles per day  
**100 Euros per LOS-profile**  
**std 2-3 m/s**  
**vert. resolution 500-1000 m**  
horiz. resolution 50/200 km  
no modification after launch  
stratospheric winds  
regular spacing

10-20 Mio. Euros for >3 years  
650 wind profiles per day  
two wind components  
**15-30 Euros per LOS-profile**  
**std 1-1.5 m/s**  
**vert. resolution 100 m**  
horiz. res.: 50 km (up to 5 km)  
no signal in very clear air  
could be operated longer

radiosonde/drops.  
**500-1000 Euros**  
**std 2-3 m/s**  
also T, q, p
